Integrable discretisations of “soliton equations”.

MKdV, SG, PKdV, Schwarzian KdV, Boussinesq and modified Boussinesq, etc.

---

Bianchi permutability (nonlinear superposition) of Bäcklund transformations leads directly to fully discrete equations.

Starting from the PDE, use Darboux transformations.

Gives a discrete Lax pair for the discrete system.

---

Starting from a discrete Lax pair, we may derive the corresponding discrete systems.

May or may not have any relation to a continuous system.

**Discrete Lax Pair:** Square Lattice: discrete coordinates  $(m, n)$ .

$$\left. \begin{aligned} \Psi_{m+1,n} &= L_{m,n} \Psi_{m,n} \\ \Psi_{m,n+1} &= M_{m,n} \Psi_{m,n} \end{aligned} \right\} \Rightarrow L_{m,n+1} M_{m,n} = M_{m+1,n} L_{m,n}.$$

can be pictured as

$$\begin{array}{ccc} (m, n+1) & \xrightarrow{L_{m,n+1}} & (m+1, n+1) \\ \uparrow M_{m,n} & & \uparrow M_{m+1,n} \\ (m, n) & \xrightarrow{L_{m,n}} & (m+1, n) \end{array}$$

**Commutativity** around the quadrilateral.

Path independent evaluation of  $\Psi_{m,n}$ :

---

**Compatibility**  $L_{m,n+1}M_{m,n} = M_{m+1,n}L_{m,n}$

implies that components of  $L$  and  $M$  satisfy  
a **discrete dynamical system**.

- ▶ Introduction
- ▶  $\mathbb{Z}_N$ -Graded Lax Pairs
- ▶ Classification
- ▶ Potentials
- ▶ Examples
- ▶ Non-Coprime Case
- ▶ Building Lattices
- ▶ Initial Value Problem
- ▶ 3D Consistency
- ▶ Conclusions

Start with the  $N \times N$  matrix

$$\Omega = \begin{pmatrix} 0 & 1 & \cdots & 0 \\ \vdots & \ddots & \ddots & \vdots \\ 0 & & \ddots & 1 \\ 1 & 0 & \cdots & 0 \end{pmatrix}.$$

---

**Definition (Level  $k$  matrix)**

An  $N \times N$  matrix  $A$  of the form

$$A = \text{diag} \left( a^{(0)}, \dots, a^{(N-1)} \right) \Omega^k$$

will be said to have level  $k$ , written  $\text{lev}(A) = k$ .

---

$\Omega$  is cyclic:  $\Omega^N = I_N$  (level 0) and

$$\text{lev}(AB) = \text{lev}(BA) = \text{lev}(A) + \text{lev}(B) \pmod{N}.$$

With

$$U_{m,n} = \text{diag} \left( u_{m,n}^{(0)}, \dots, u_{m,n}^{(N-1)} \right) \Omega^{k_1},$$

$$V_{m,n} = \text{diag} \left( v_{m,n}^{(0)}, \dots, v_{m,n}^{(N-1)} \right) \Omega^{k_2},$$

consider the Lax pair

$$\Psi_{m+1,n} = L_{m,n} \Psi_{m,n} \equiv \left( U_{m,n} + \lambda \Omega^{\ell_1} \right) \Psi_{m,n}, \quad k_1 \neq \ell_1,$$

$$\Psi_{m,n+1} = M_{m,n} \Psi_{m,n} \equiv \left( V_{m,n} + \lambda \Omega^{\ell_2} \right) \Psi_{m,n}, \quad k_2 \neq \ell_2,$$

with compatibility condition  $L_{m,n+1} M_{m,n} = M_{m+1,n} L_{m,n}$ .

Equating powers of  $\lambda$ :

$$\begin{aligned} U_{m,n+1} V_{m,n} &= V_{m+1,n} U_{m,n}, \\ U_{m,n+1} \Omega^{\ell_2} - \Omega^{\ell_2} U_{m,n} &= V_{m+1,n} \Omega^{\ell_1} - \Omega^{\ell_1} V_{m,n}. \end{aligned}$$

and we find  $k_1 + \ell_2 \equiv k_2 + \ell_1 \pmod{N}$ .

Example  $N = 4$

Matrix  $L$  with  $(k_1, \ell_1) = (1, 2)$

$$L_{m,n} = \begin{pmatrix} 0 & u_{m,n}^{(0)} & \lambda & 0 \\ 0 & 0 & u_{m,n}^{(1)} & \lambda \\ \lambda & 0 & 0 & u_{m,n}^{(2)} \\ u_{m,n}^{(3)} & \lambda & 0 & 0 \end{pmatrix}$$

---

The Level Structure of matrices  $L$  and  $M$  is labelled

$$(k_1, \ell_1; k_2, \ell_2).$$

with

$$\ell_2 - k_2 \equiv \ell_1 - k_1 \pmod{N}$$

## The compatibility conditions

$$\begin{aligned} U_{m,n+1} V_{m,n} &= V_{m+1,n} U_{m,n}, \\ U_{m,n+1} \Omega^{\ell_2} - \Omega^{\ell_2} U_{m,n} &= V_{m+1,n} \Omega^{\ell_1} - \Omega^{\ell_1} V_{m,n}, \end{aligned}$$

are explicitly written as

$$\begin{aligned} u_{m,n+1}^{(i)} v_{m,n}^{(i+k_1)} &= v_{m+1,n}^{(i)} u_{m,n}^{(i+k_2)}, \\ u_{m,n+1}^{(i)} - u_{m,n}^{(i+\ell_2)} &= v_{m+1,n}^{(i)} - v_{m,n}^{(i+\ell_1)}, \end{aligned}$$

which can be solved to give:

$$\begin{aligned} u_{m,n+1}^{(i)} &= \frac{u_{m,n}^{(i+\ell_2)} - v_{m,n}^{(i+\ell_1)}}{u_{m,n}^{(i+k_2)} - v_{m,n}^{(i+k_1)}} u_{m,n}^{(i+k_2)}, \\ v_{m+1,n}^{(i)} &= \frac{u_{m,n}^{(i+\ell_2)} - v_{m,n}^{(i+\ell_1)}}{u_{m,n}^{(i+k_2)} - v_{m,n}^{(i+k_1)}} v_{m,n}^{(i+\ell_1)}. \end{aligned}$$

## Equivalent Lax Pairs

1. Switching  $m$  and  $n$ , so

$$L \leftrightarrow M \quad \text{and} \quad (k_1, \ell_1) \leftrightarrow (k_2, \ell_2).$$

2.  $(k_i, \ell_i) \mapsto (N - k_i, N - \ell_i)$ , so

$$(u_{m,n}^{(i)}, v_{m,n}^{(i)}) \mapsto (u_{m,n}^{(N-i)}, v_{m,n}^{(N-i)}).$$

## The coprime case satisfies

$$(N, \ell_1 - k_1) = (N, \ell_2 - k_2) = 1.$$

We then have

$$|L| = a - (-\lambda)^N, \quad \text{where} \quad a = \prod_{j=0}^{N-1} u^j \quad \text{and} \quad \Delta_n a = 0.$$

$$|M| = b - (-\lambda)^N, \quad \text{where} \quad b = \prod_{j=0}^{N-1} v^j \quad \text{and} \quad \Delta_m b = 0.$$

Subdivision of the coprime case  $(N, \ell_1 - k_1) = (N, \ell_2 - k_2) = 1$ .

We may reduce to the submanifold

$$\prod_{j=0}^{N-1} u_{m,n}^{(j)} = a, \quad \prod_{j=0}^{N-1} v_{m,n}^{(j)} = b \quad (\text{constants}).$$

---

The generic subcase:  $ab \neq 0$ .

The above relations allow us to express one function from each set in terms of the remaining ones.

---

The degenerate subcase:  $a \neq 0, b = 0$ .

We can eliminate one of the  $u^{(j)}$  and set (wlog)  $v^{(N-1)} = 0$ .

The degenerate case  $a = b = 0$  is empty.

The non-coprime case:  $(N, \ell_1 - k_1) = (N, \ell_2 - k_2) = p > 1$ .

Determinant factorises:

---

$$(N, k_1, \ell_1) = (6, 1, 3) \quad (p = 2)$$

$$|L| = -(\lambda^3 + u_{m,n}^{(0)} u_{m,n}^{(2)} u_{m,n}^{(4)})(\lambda^3 + u_{m,n}^{(1)} u_{m,n}^{(3)} u_{m,n}^{(5)}).$$

---

$$(N, k_1, \ell_1) = (6, 1, 4) \quad (p = 3)$$

$$|L| = (\lambda^2 - u_{m,n}^{(0)} u_{m,n}^{(3)})(\lambda^2 - u_{m,n}^{(1)} u_{m,n}^{(4)})(\lambda^2 - u_{m,n}^{(2)} u_{m,n}^{(5)}).$$

---

Can transform to **block matrix form**, corresponding to a **coupling** of smaller coprime systems.

## The general equations

$$\begin{aligned} u_{m,n+1}^{(i)} v_{m,n}^{(i+k_1)} &= v_{m+1,n}^{(i)} u_{m,n}^{(i+k_2)}, \\ u_{m,n+1}^{(i)} - u_{m,n}^{(i+\ell_2)} &= v_{m+1,n}^{(i)} - v_{m,n}^{(i+\ell_1)}, \end{aligned}$$

can be reduced by **introducing potentials**.

**The first** holds identically if we set

**Quotient Potential**

$$u_{m,n}^{(i)} = \alpha \frac{\phi_{m+1,n}^{(i)}}{\phi_{m,n}^{(i+k_1)}}, \quad v_{m,n}^{(i)} = \beta \frac{\phi_{m,n+1}^{(i)}}{\phi_{m,n}^{(i+k_2)}}, \quad i \in \mathbb{Z}_N.$$

**The second** holds identically if we set

**Additive Potential**

$$u_{m,n}^{(i)} = \chi_{m+1,n}^{(i)} - \chi_{m,n}^{(i+\ell_1)}, \quad v_{m,n}^{(i)} = \chi_{m,n+1}^{(i)} - \chi_{m,n}^{(i+\ell_2)}, \quad i \in \mathbb{Z}_N.$$

Quotient Potential: we set  $(i \in \mathbb{Z}_N \text{ throughout})$

$$u_{m,n}^{(i)} = \alpha \frac{\phi_{m+1,n}^{(i)}}{\phi_{m,n}^{(i+k_1)}}, \quad v_{m,n}^{(i)} = \beta \frac{\phi_{m,n+1}^{(i)}}{\phi_{m,n}^{(i+k_2)}}.$$

The second equation then take the form

$$\alpha \left( \frac{\phi_{m+1,n+1}^{(i)}}{\phi_{m,n+1}^{(i+k_1)}} - \frac{\phi_{m+1,n}^{(i+l_2)}}{\phi_{m,n}^{(i+k_1+l_2)}} \right) = \beta \left( \frac{\phi_{m+1,n+1}^{(i)}}{\phi_{m+1,n}^{(i+k_2)}} - \frac{\phi_{m,n+1}^{(i+l_1)}}{\phi_{m,n}^{(i+k_2+l_1)}} \right).$$

The solved form is written as

$$\phi_{m+1,n+1}^{(i)} = \frac{\phi_{m,n+1}^{(i+k_1)} \phi_{m+1,n}^{(i+k_2)}}{\phi_{m,n}^{(i+k_1+l_2)}} \left( \frac{\alpha \phi_{m+1,n}^{(i+l_2)} - \beta \phi_{m,n+1}^{(i+l_1)}}{\alpha \phi_{m+1,n}^{(i+k_2)} - \beta \phi_{m,n+1}^{(i+k_1)}} \right).$$

$$\prod_{i=0}^{N-1} \phi_{m,n}^{(i)} = 1$$

Reduces number of components.

## The equation

$$\alpha \left( \frac{\phi_{m+1,n+1}^{(i)}}{\phi_{m,n+1}^{(i+k_1)}} - \frac{\phi_{m+1,n}^{(i+l_2)}}{\phi_{m,n}^{(i+k_1+l_2)}} \right) = \beta \left( \frac{\phi_{m+1,n+1}^{(i)}}{\phi_{m+1,n}^{(i+k_2)}} - \frac{\phi_{m,n+1}^{(i+l_1)}}{\phi_{m,n}^{(i+k_2+l_1)}} \right).$$

can be solve for each vertex of the square:

Initial values given on a staircase:

## The Lax Pair in potential form

$$\Psi_{m+1,n} = \left( \alpha \phi_{m+1,n} \Omega^{k_1} \phi_{m,n}^{-1} + \lambda \Omega^{\ell_1} \right) \Psi_{m,n},$$

$$\Psi_{m,n+1} = \left( \beta \phi_{m,n+1} \Omega^{k_2} \phi_{m,n}^{-1} + \lambda \Omega^{\ell_2} \right) \Psi_{m,n},$$

where

$$\phi_{m,n} := \text{diag} \left( \phi_{m,n}^{(0)}, \dots, \phi_{m,n}^{(N-1)} \right).$$

---

Equivalence relation:  $\tilde{\Psi}_{m,n} = \alpha^{-m} \beta^{-n} \lambda^{-m-n} \phi_{m,n}^{-1} \Psi_{m,n}$ .

gives

$$(\phi^{(i)}; k_1, l_1, \alpha; k_2, l_2, \beta) \leftrightarrow (\tilde{\phi}^{(i)}; l_1, k_1, \tilde{\alpha}; l_2, k_2, \tilde{\beta})$$

where

$$\phi_{m,n}^{(i)} \tilde{\phi}_{m,n}^{(i)} = 1, \quad \alpha \tilde{\alpha} = 1, \quad \beta \tilde{\beta} = 1, \quad \lambda \mapsto \lambda^{-1}$$

**Additive Potential:** we set  $(i \in \mathbb{Z}_N \text{ throughout})$

$$u_{m,n}^{(i)} = \chi_{m+1,n}^{(i)} - \chi_{m,n}^{(i+\ell_1)}, \quad v_{m,n}^{(i)} = \chi_{m,n+1}^{(i)} - \chi_{m,n}^{(i+\ell_2)}.$$

The first equation then take the form

$$\begin{aligned} & \left( \chi_{m+1,n+1}^{(i)} - \chi_{m,n+1}^{(i+\ell_1)} \right) \left( \chi_{m,n+1}^{(i+k_1)} - \chi_{m,n}^{(i+k_1+\ell_2)} \right) \\ &= \left( \chi_{m+1,n+1}^{(i)} - \chi_{m+1,n}^{(i+\ell_2)} \right) \left( \chi_{m+1,n}^{(i+k_2)} - \chi_{m,n}^{(i+k_2+\ell_1)} \right). \end{aligned}$$

The solved form is written as

$$\chi_{m+1,n+1}^{(i)} = \frac{\chi_{m,n+1}^{(i+k_1)} \chi_{m,n+1}^{(i+\ell_1)} - \chi_{m+1,n}^{(i+k_2)} \chi_{m+1,n}^{(i+\ell_2)} - \chi_{m,n}^{(i+k_1+\ell_2)} (\chi_{m,n+1}^{(i+\ell_1)} - \chi_{m+1,n}^{(i+\ell_2)})}{\chi_{m,n+1}^{(i+k_1)} - \chi_{m+1,n}^{(i+k_2)}}.$$

---

These are Bäcklund related to the quotient potential equations.

- ▶ Introduction
- ▶  $\mathbb{Z}_N$ -Graded Lax Pairs
- ▶ Classification
- ▶ Potentials
- ▶ **Examples**
- ▶ Non-Coprime Case
- ▶ Building Lattices
- ▶ Initial Value Problem
- ▶ 3D Consistency
- ▶ Conclusions

In  $2D$  we have a unified description of several well known examples.

For quotient potentials we can set  $\phi_{m,n}^{(0)}\phi_{m,n}^{(1)} = 1$ .

Level structure  $(0, 1; 0, 1)$

$$\alpha (\phi_{m,n}\phi_{m,n+1} - \phi_{m+1,n}\phi_{m+1,n+1}) - \beta (\phi_{m,n}\phi_{m+1,n} - \phi_{m,n+1}\phi_{m+1,n+1}) = 0,$$

where  $\phi_{m,n} = \phi_{m,n}^{(0)} = 1/\phi_{m,n}^{(1)}$ . (Discrete MKdV equation.)

Level structure  $(0, 1; 1, 0)$

$$\alpha (\phi_{m,n}\phi_{m+1,n+1} - \phi_{m+1,n}\phi_{m,n+1}) - \beta (\phi_{m,n}\phi_{m+1,n}\phi_{m,n+1}\phi_{m+1,n+1} - 1) = 0,$$

where  $\phi_{m,n} = \phi_{m,n}^{(0)} = 1/\phi_{m,n}^{(1)}$ . (Hirota's discrete sine-Gordon equation.)

For additive potentials we have the first integrals

$$\prod_{i=0}^{N-1} \left( \chi_{m+1,n}^{(i)} - \chi_{m,n}^{(i+\ell_1)} \right) = \alpha^N, \quad \prod_{i=0}^{N-1} \left( \chi_{m,n+1}^{(i)} - \chi_{m,n}^{(i+\ell_2)} \right) = \beta^N.$$

---

Level structure  $(0, 1; 0, 1)$

Using the first integrals to replace either  $\chi^{(0)}$  or  $\chi^{(1)}$ :

$$(\chi_{m+1,n+1} - \chi_{m,n}) (\chi_{m+1,n} - \chi_{m,n+1}) = \alpha^2 - \beta^2,$$

which is the **discrete potential KdV**.

---

Level structure  $(1, 0; 1, 0)$

Using the first integrals to eliminate one of the variables:

$$\begin{aligned} \alpha^2 (\chi_{m,n} - \chi_{m,n+1}) (\chi_{m+1,n} - \chi_{m+1,n+1}) \\ - \beta^2 (\chi_{m,n} - \chi_{m+1,n}) (\chi_{m,n+1} - \chi_{m+1,n+1}) = 0. \end{aligned}$$

which is the **Schwarzian KdV equation**

The 2D degenerate case

$$u_{m,n}^{(0)} u_{m,n}^{(1)} = a, \quad v_{m,n}^{(1)} = 0,$$

gives Hirota's KdV equation:

$$\frac{a}{u_{m+1,n+1}} + u_{m,n+1} = u_{m+1,n} + \frac{a}{u_{m,n}}.$$

---

In higher dimensions, we derive a new generalisation of this, involving  $2N$  points.

In  $3D$  and above our scheme gives either generalisations of well known  $2D$  examples or **new families of integrable systems**.

---

For **quotient potentials** we can set  $\prod_{i=0}^2 \phi_{m,n}^{(i)} = 1$ .

We use the following substitution:

$$\left( \phi_{m,n}^{(0)}, \phi_{m,n}^{(1)}, \phi_{m,n}^{(2)} \right) \mapsto \left( \frac{1}{\phi_{m,n}^{(0)}}, \phi_{m,n}^{(1)}, \frac{\phi_{m,n}^{(0)}}{\phi_{m,n}^{(1)}} \right).$$

Two Equivalence Relations for the quotient potential:

1.  $(k_i, \ell_i) \mapsto (N - k_i, N - \ell_i)$ ,
2.  $(k_i, \ell_i) \leftrightarrow (\ell_i, k_i)$ .

---

In 3D we therefore have the following inequivalent cases:

1. Level structure  $(0, 1; 0, 1)$  (modified Boussinesq),
2. Level structure  $(0, 1; 1, 2)$  (a new integrable system),
3. Level structure  $(0, 1; 2, 0)$  (a new integrable system),
4. Level structure  $(1, 2; 1, 2)$  (a new integrable system).

---

The case  $(0, 1; 2, 0)$  is specific to  $N = 3$ , since

$$2 + 1 \equiv 0 + 0 \pmod{3}.$$

Level structure  $(0, 1; 0, 1)$ 

$$\phi_{m+1,n+1}^{(0)} = \frac{\alpha \phi_{m,n+1}^{(0)} - \beta \phi_{m+1,n}^{(0)}}{\alpha \phi_{m+1,n}^{(1)} - \beta \phi_{m,n+1}^{(1)}} \phi_{m,n}^{(1)},$$

$$\phi_{m+1,n+1}^{(1)} = \frac{\alpha \phi_{m+1,n}^{(0)} \phi_{m,n+1}^{(1)} - \beta \phi_{m,n+1}^{(0)} \phi_{m+1,n}^{(1)}}{\alpha \phi_{m+1,n}^{(1)} - \beta \phi_{m,n+1}^{(1)}} \frac{\phi_{m,n}^{(1)}}{\phi_{m,n}^{(0)}}.$$

This equation is related to the **modified Boussinesq** equation.

---

Special case of **nonlinear superposition** of 2D Toda lattice, related to modified Lax equations. (**Fordy-Gibbons 1980**)

---

Rediscovered by (**Nijhoff, et al, 1992**) in the context of **discrete integrable systems**.

## Level structure (1, 2; 1, 2)

$$\phi_{m+1,n+1}^{(0)} = \frac{\alpha \phi_{m+1,n}^{(1)} - \beta \phi_{m,n+1}^{(1)}}{\alpha \phi_{m+1,n}^{(0)} \phi_{m,n+1}^{(1)} - \beta \phi_{m,n+1}^{(0)} \phi_{m+1,n}^{(1)}} \frac{1}{\phi_{m,n}^{(0)}},$$

$$\phi_{m+1,n+1}^{(1)} = \frac{\alpha \phi_{m,n+1}^{(0)} - \beta \phi_{m+1,n}^{(0)}}{\alpha \phi_{m+1,n}^{(0)} \phi_{m,n+1}^{(1)} - \beta \phi_{m,n+1}^{(0)} \phi_{m+1,n}^{(1)}} \frac{1}{\phi_{m,n}^{(1)}}.$$

This is a new integrable system.

The reduction

$$\phi_{m,n}^{(0)} = \phi_{m,n}^{(1)} = \frac{-1}{2^{1/3} u_{m,n}}, \quad \beta = -\alpha.$$

leads to a **discrete Tzitzeica equation** (Mikhailov and Xenitidis):

$$u_{m,n} u_{m+1,n+1} (u_{m+1,n} + u_{m,n+1}) + 1 = 0.$$

## Additive Potential    Level structure $(0, 1; 0, 1)$

$$\chi_{m+1,n+1}^{(i)} = \frac{(\chi_{m+1,n}^{(i)} - \chi_{m,n}^{(i+1)})\chi_{m+1,n}^{(i+1)} - (\chi_{m,n+1}^{(i)} - \chi_{m,n}^{(i+1)})\chi_{m,n+1}^{(i+1)}}{\chi_{m+1,n}^{(i)} - \chi_{m,n+1}^{(i)}},$$

$$\chi_{m+1,n+1}^{(i+1)} = \chi_{m,n}^{(i)} + \frac{1}{\chi_{m+1,n}^{(i+1)} - \chi_{m,n+1}^{(i+1)}} \left( \frac{\alpha^3}{\chi_{m+1,n}^{(i)} - \chi_{m,n}^{(i+1)}} - \frac{\beta^3}{\chi_{m,n+1}^{(i)} - \chi_{m,n}^{(i+1)}} \right).$$

This is a **two component** system with fixed  $i = 0$  (or 1 or 2).

This is a **new integrable system**, which can be decoupled to a nine point scalar equation (the **discrete potential Boussinesq** equation).

- ▶ Introduction
- ▶  $\mathbb{Z}_N$ -Graded Lax Pairs
- ▶ Classification
- ▶ Potentials
- ▶ Examples
- ▶ Non-Coprime Case
- ▶ Building Lattices
- ▶ Initial Value Problem
- ▶ 3D Consistency
- ▶ Conclusions

The Non-Coprime Case has  $(N, \ell_j - k_j) = p > 1$ .

For  $N = pq$ ,  $\ell_j - k_j = pr$ ,  $(q, r) = 1$  the variables are grouped together

$$\mathbf{u}_i = (u^{(i)}, u^{(i+p)}, \dots, u^{(i+p(q-1))}), \quad i = 0, \dots, p-1.$$

and

$$\mathbf{v}_i = (v^{(i)}, v^{(i+p)}, \dots, v^{(i+p(q-1))}), \quad i = 0, \dots, p-1.$$

The permutation matrix which re-orders them like this, can be used to put  $L$  and  $M$  in block form:

$p \times p$  matrices of  $q \times q$  blocks.

For  $N = 6$  with  $p = 3$ ,  $q = 2$ ,  $r = 1$  there are several compatible level structures.

The choices  $(1, 4)$  and  $(2, 5)$  give the following forms for  $L$ :

$$L = \begin{pmatrix} 0 & L_{03}^{(0,1)} & 0 \\ 0 & 0 & L_{14}^{(0,1)} \\ L_{25}^{(1,0)} & 0 & 0 \end{pmatrix}, \quad L = \begin{pmatrix} 0 & 0 & L_{03}^{(0,1)} \\ L_{14}^{(1,0)} & 0 & 0 \\ 0 & L_{25}^{(1,0)} & 0 \end{pmatrix},$$

where  $L_{ab}^{(k,\ell)}$  is the  $2 \times 2$  Lax matrix of level structure  $(k, \ell)$  and depending on variables  $u_{m,n}^{(a)}$  and  $u_{m,n}^{(b)}$ .

For example

$$L_{03}^{(0,1)} = \begin{pmatrix} u_{m,n}^{(0)} & \lambda \\ \lambda & u_{m,n}^{(3)} \end{pmatrix}, \quad L_{25}^{(1,0)} = \begin{pmatrix} \lambda & u_{m,n}^{(2)} \\ u_{m,n}^{(5)} & \lambda \end{pmatrix}.$$

Similarly for  $M$  (but depending upon  $v_{m,n}^{(a)}$ ,  $v_{m,n}^{(b)}$ ).

The choice  $(2, 5; 2, 5)$  leads to the system

$$\begin{aligned} L_{03}^{(0,1)}(\mathbf{u}_{m,n+1})M_{25}^{(1,0)}(\mathbf{v}_{m,n}) &= M_{03}^{(0,1)}(\mathbf{v}_{m+1,n})L_{25}^{(1,0)}(\mathbf{u}_{m,n}), \\ L_{14}^{(1,0)}(\mathbf{u}_{m,n+1})M_{03}^{(0,1)}(\mathbf{v}_{m,n}) &= M_{14}^{(1,0)}(\mathbf{v}_{m+1,n})L_{03}^{(0,1)}(\mathbf{u}_{m,n}), \\ L_{25}^{(1,0)}(\mathbf{u}_{m,n+1})M_{14}^{(1,0)}(\mathbf{v}_{m,n}) &= M_{25}^{(1,0)}(\mathbf{v}_{m+1,n})L_{14}^{(1,0)}(\mathbf{u}_{m,n}), \end{aligned}$$

In potential form, with

$$\phi_{m,n}^{(0)} = 1/\phi_{m,n}^{(3)} = \psi_{m,n}^{(0)}, \phi_{m,n}^{(4)} = 1/\phi_{m,n}^{(1)} = \psi_{m,n}^{(1)}, \phi_{m,n}^{(2)} = 1/\phi_{m,n}^{(5)} = \psi_{m,n}^{(2)},$$

we obtain the **coupled discrete MKdV** system

$$\psi_{m+1,n+1}^{(i)} = \left( \frac{\alpha\psi_{m,n+1}^{(i+2)} - \beta\psi_{m+1,n}^{(i+2)}}{\alpha\psi_{m+1,n}^{(i+2)} - \beta\psi_{m,n+1}^{(i+2)}} \right) \psi_{m,n}^{(i+1)}, \quad i \in \mathbb{Z}_3.$$

The choice  $(1, 4; 2, 5)$  leads to the system

$$\psi_{m,n}^{(i)} \psi_{m+1,n+1}^{(i)} = \frac{\alpha - \beta \psi_{m,n+1}^{(i+1)} \psi_{m+1,n}^{(i+2)}}{\alpha \psi_{m,n+1}^{(i+1)} \psi_{m+1,n}^{(i+2)} - \beta}, \quad i \in \mathbb{Z}_3,$$

which is a **coupled system** of Hirota's **discrete sine-Gordon** equations.

A consistent lattice is such that around each elementary quadrilateral, we have

$$L_{m,n+1}M_{m,n} = M_{m+1,n}L_{m,n}.$$

One choice is to take the same  $L$  and  $M$  around each quadrilateral.

However, we can choose a variety of level structures  $(k_1, \ell_1; k_2, \ell_2)$ , subject only to

$$\ell_j - k_j \text{ being fixed } \pmod{N} \text{ over the lattice.}$$

Opposite edges carry matrices with exactly the same structure.

For  $N = 2$  and  $N = 3$  we can choose:

Non-coprime systems form subsystems.

For the **discrete MKdV case** we had separate consistency equations:

$$L_{03}^{(0,1)}(\mathbf{u}_{m,n+1})M_{25}^{(1,0)}(\mathbf{v}_{m,n}) = M_{03}^{(0,1)}(\mathbf{v}_{m+1,n})L_{25}^{(1,0)}(\mathbf{u}_{m,n})$$

**Matching edges** can be glued together.

The **coupled discrete MKdV** system

$$\psi_{m+1,n+1}^{(i)} = \left( \frac{\alpha\psi_{m,n+1}^{(i+2)} - \beta\psi_{m+1,n}^{(i+2)}}{\alpha\psi_{m+1,n}^{(i+2)} - \beta\psi_{m,n+1}^{(i+2)}} \right) \psi_{m,n}^{(i+1)}, \quad i \in \mathbb{Z}_3.$$

**Matching edges** can be glued together.

We can build 3 different lattices with a **single component**  $\psi_{m,n}^{(i)}$  at each site.

This can then be **periodically extended** in any direction.

---

The original lattice is a superposition of the 3 single component lattices.

## The Initial Value Problem: 3 steps.

**Figure:** Patterns on the lattice and initial value problems with  $(i, j, k) \in \{(0, 1, 2), (1, 2, 0), (2, 0, 1)\}$  : Every black vertex carries the initial value of the corresponding variable, e.g. the left bottom vertex carries the initial value of  $\psi^{(i)}$ . This initial pattern repeats after three diagonal steps leading to the updated gray vertices.

3D Consistency. We can build a 3D cube with these faces:

There are 3 such cubes:  $i \in \{0, 1, 2\}$

We can place 27 such cubes to form a  $3 \times 3 \times 3$  cube, which can be periodically extended.

Each face is one of our 2D lattices.

## Conclusions:

- ▶ The general scheme we introduced has led to a unified description of many **known** discrete integrable systems.
- ▶ Each of these is generalised to arbitrary  $N$  dimensions.
- ▶ Many **new** systems are included.
- ▶ Multicoloured lattices.
- ▶ Non-Coprime Case: coupled systems of lower dimensional equations.
- ▶ 3D Consistency

## Further Results:

- ▶ Continuous symmetries and master symmetries: classification and hierarchies.
- ▶ Nonlocal symmetries and Bäcklund Transformations of the 2D Toda Lattice.
- ▶ Nonlinear superposition formula as Discrete Integrable Systems.
