

A variable-fidelity surrogate modelling approach

Anna Bertram, TU Braunschweig, Germany

Ralf Zimmermann, Syddansk Universitet, Denmark

Motivation

Car shape optimization

Development of an *Interactive Aerodynamic Design* process

~ Approximation of high-dimensional aerodynamic quantities in near-real time

Idea: Combine variable-fidelity interpolation methods with POD to efficiently generate accurate surrogate models

Interpolation method: Kriging

Given: sample points $x^1, \dots, x^n \in \mathbb{R}^d$

sample points $x_1, \dots, x_n \in \mathbb{R}$
 sample values $y := (y_1, \dots, y_n)^T \in \mathbb{R}^n$

Objective: interpolate and take spatial correlation into account

Assumption: true function $y(x) = f(x)^T \beta + s(x)$

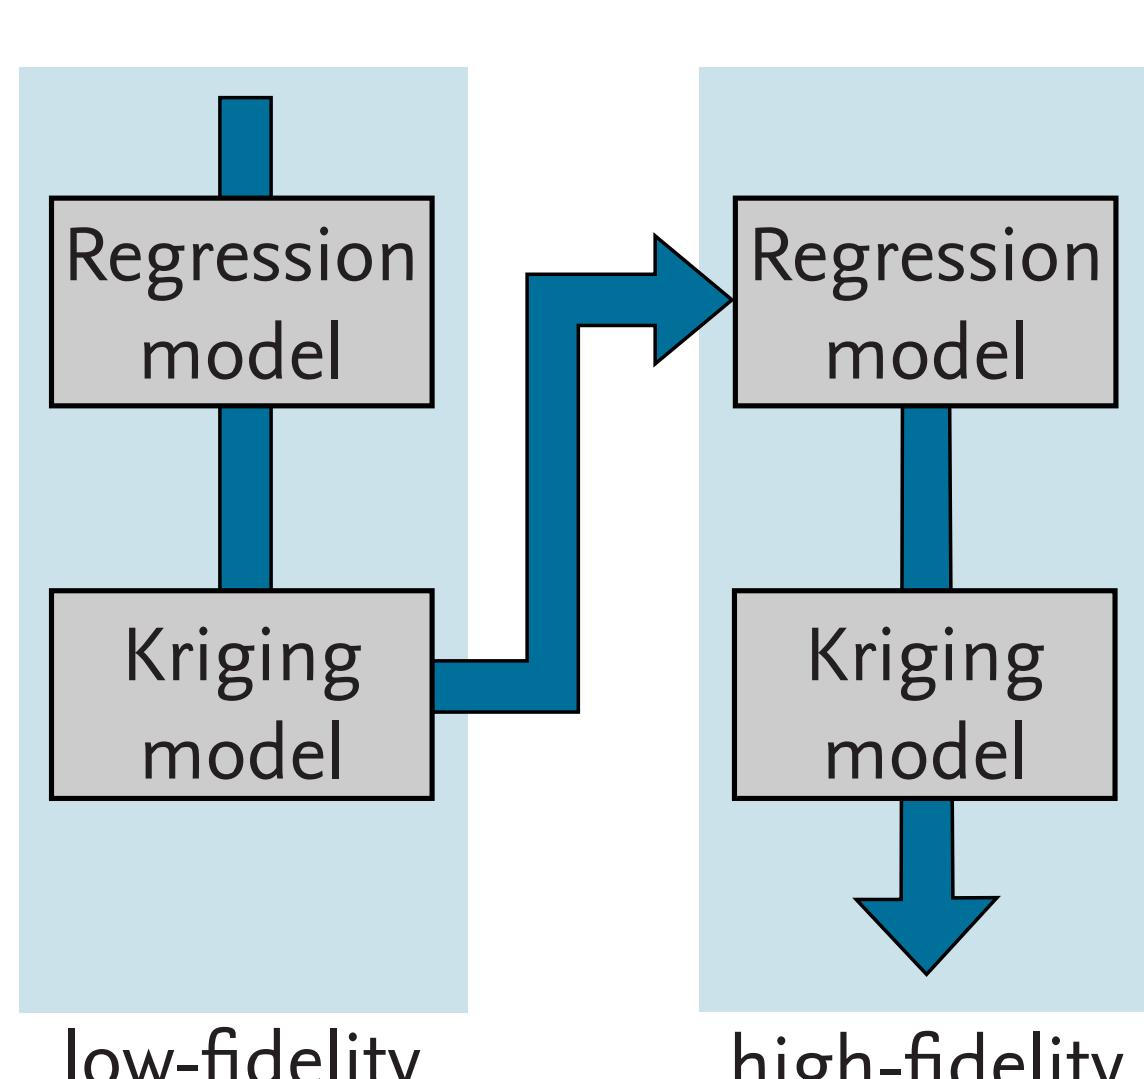

$$y(x) = f(x)^T p + \varepsilon(x)$$

\swarrow \qquad \downarrow \qquad \searrow

regression function regression param. norm. distr. error

Kriging leads to the Best Linear Unbiased Estimator (BLUE)

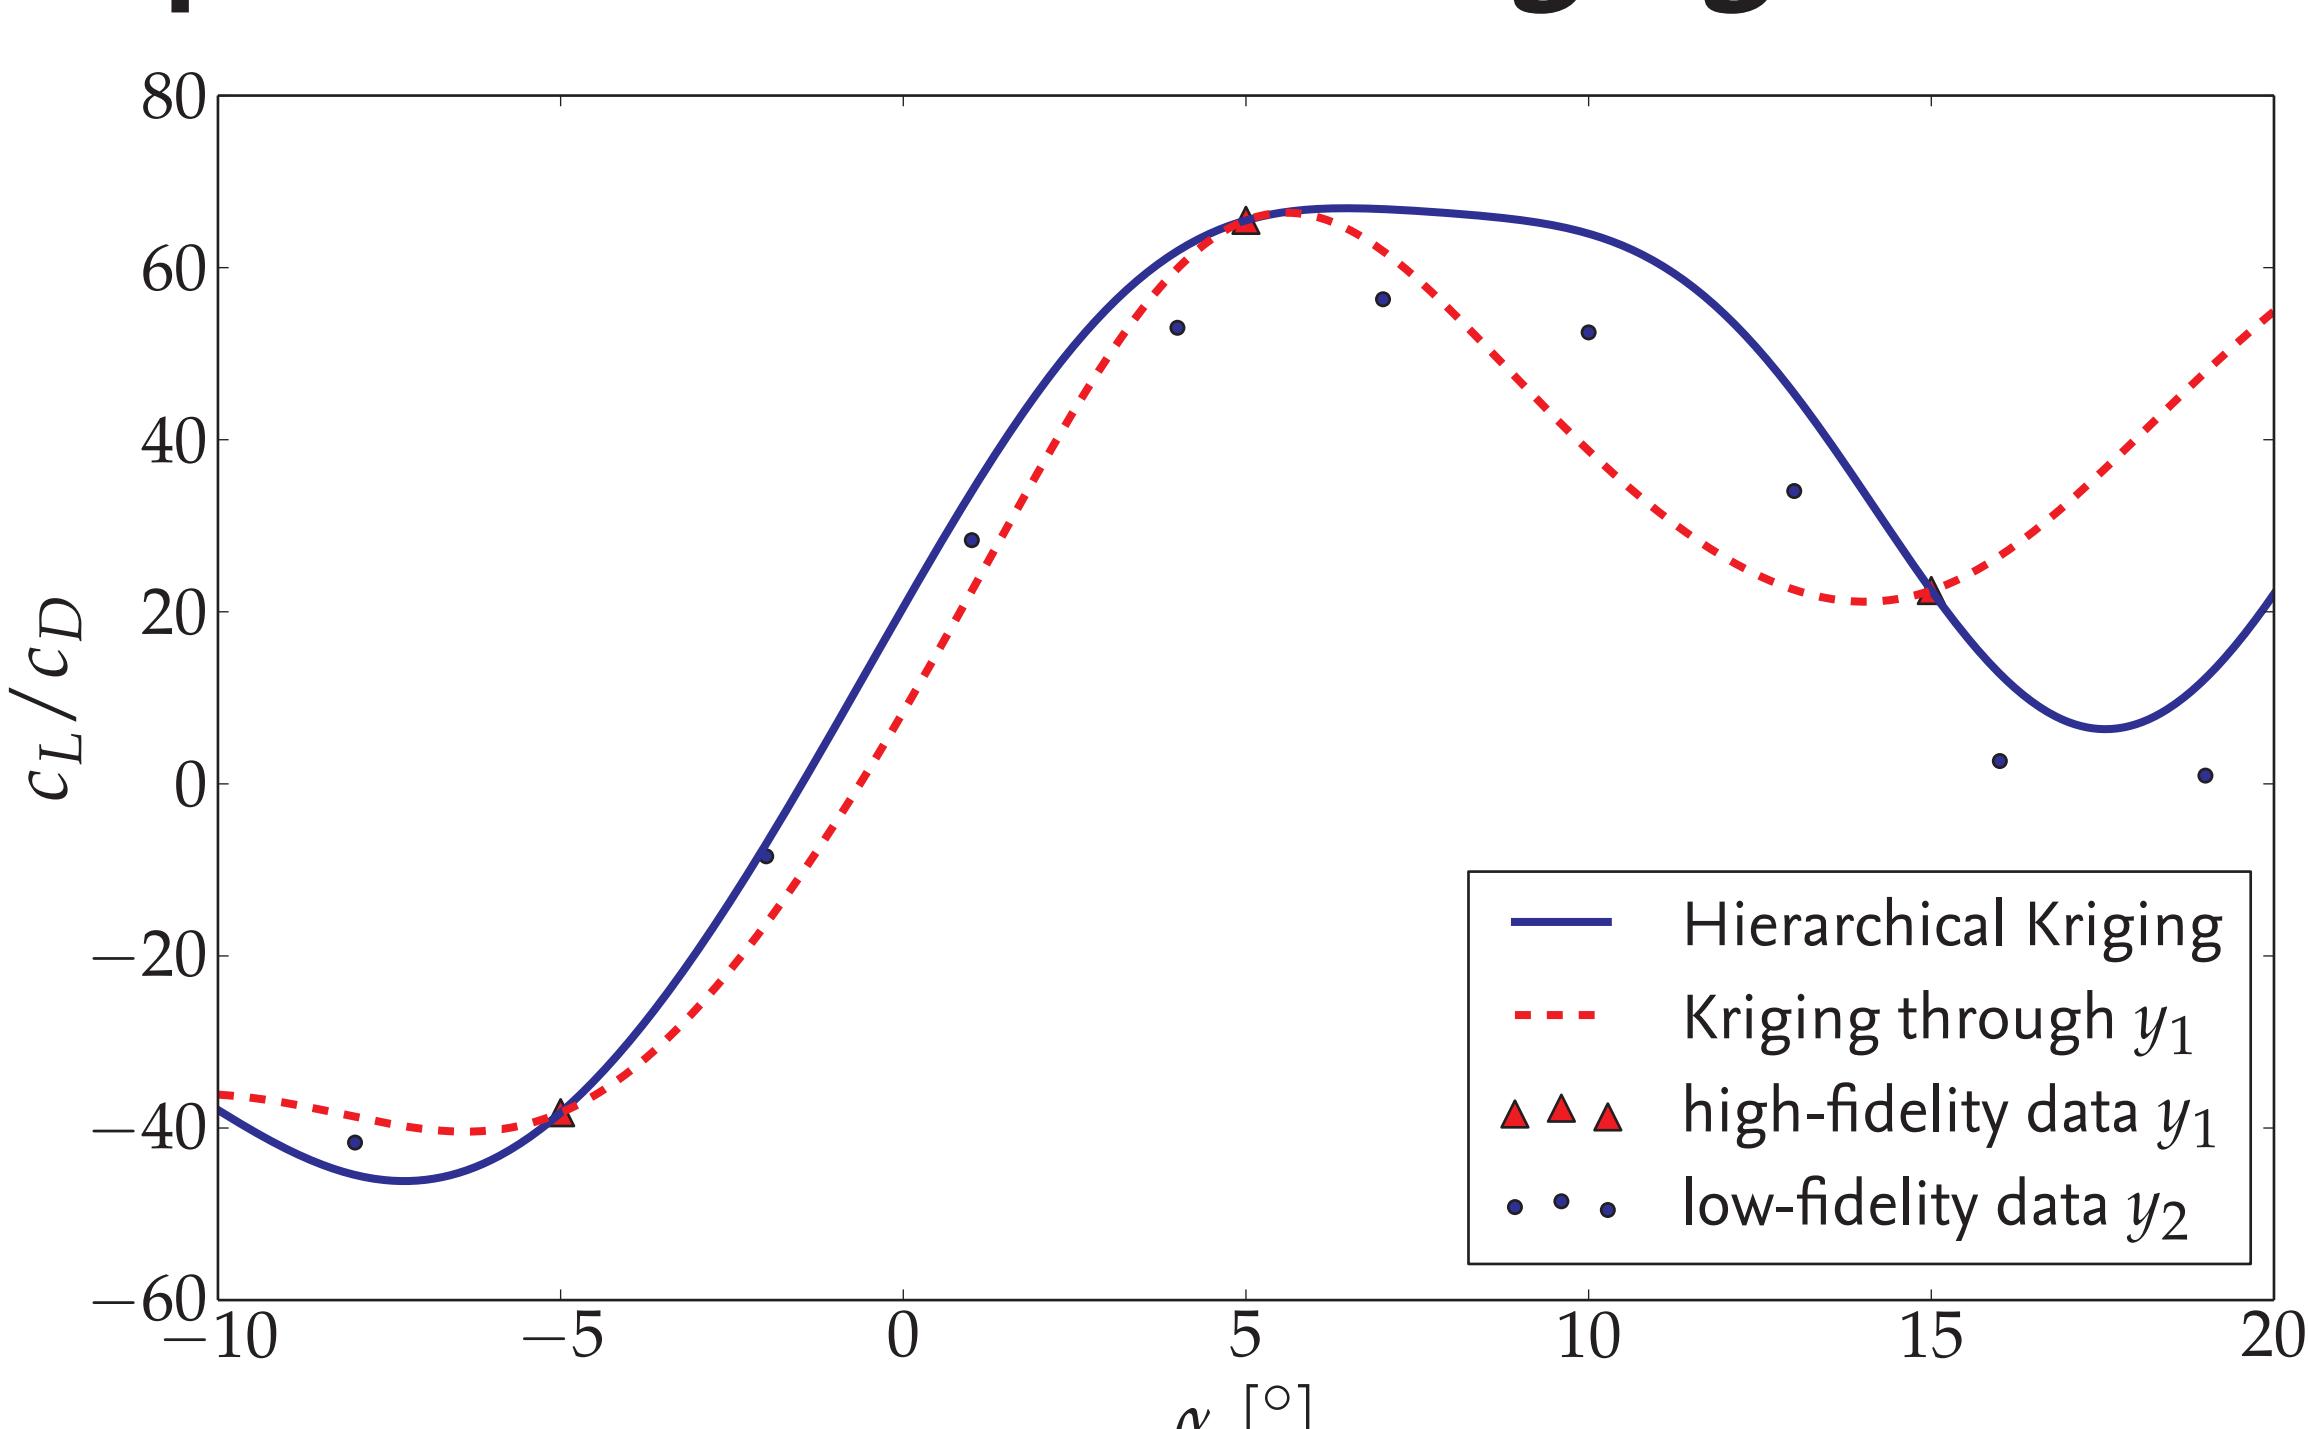

Hierarchical Kriging is a variable-fidelity extension of Kriging:

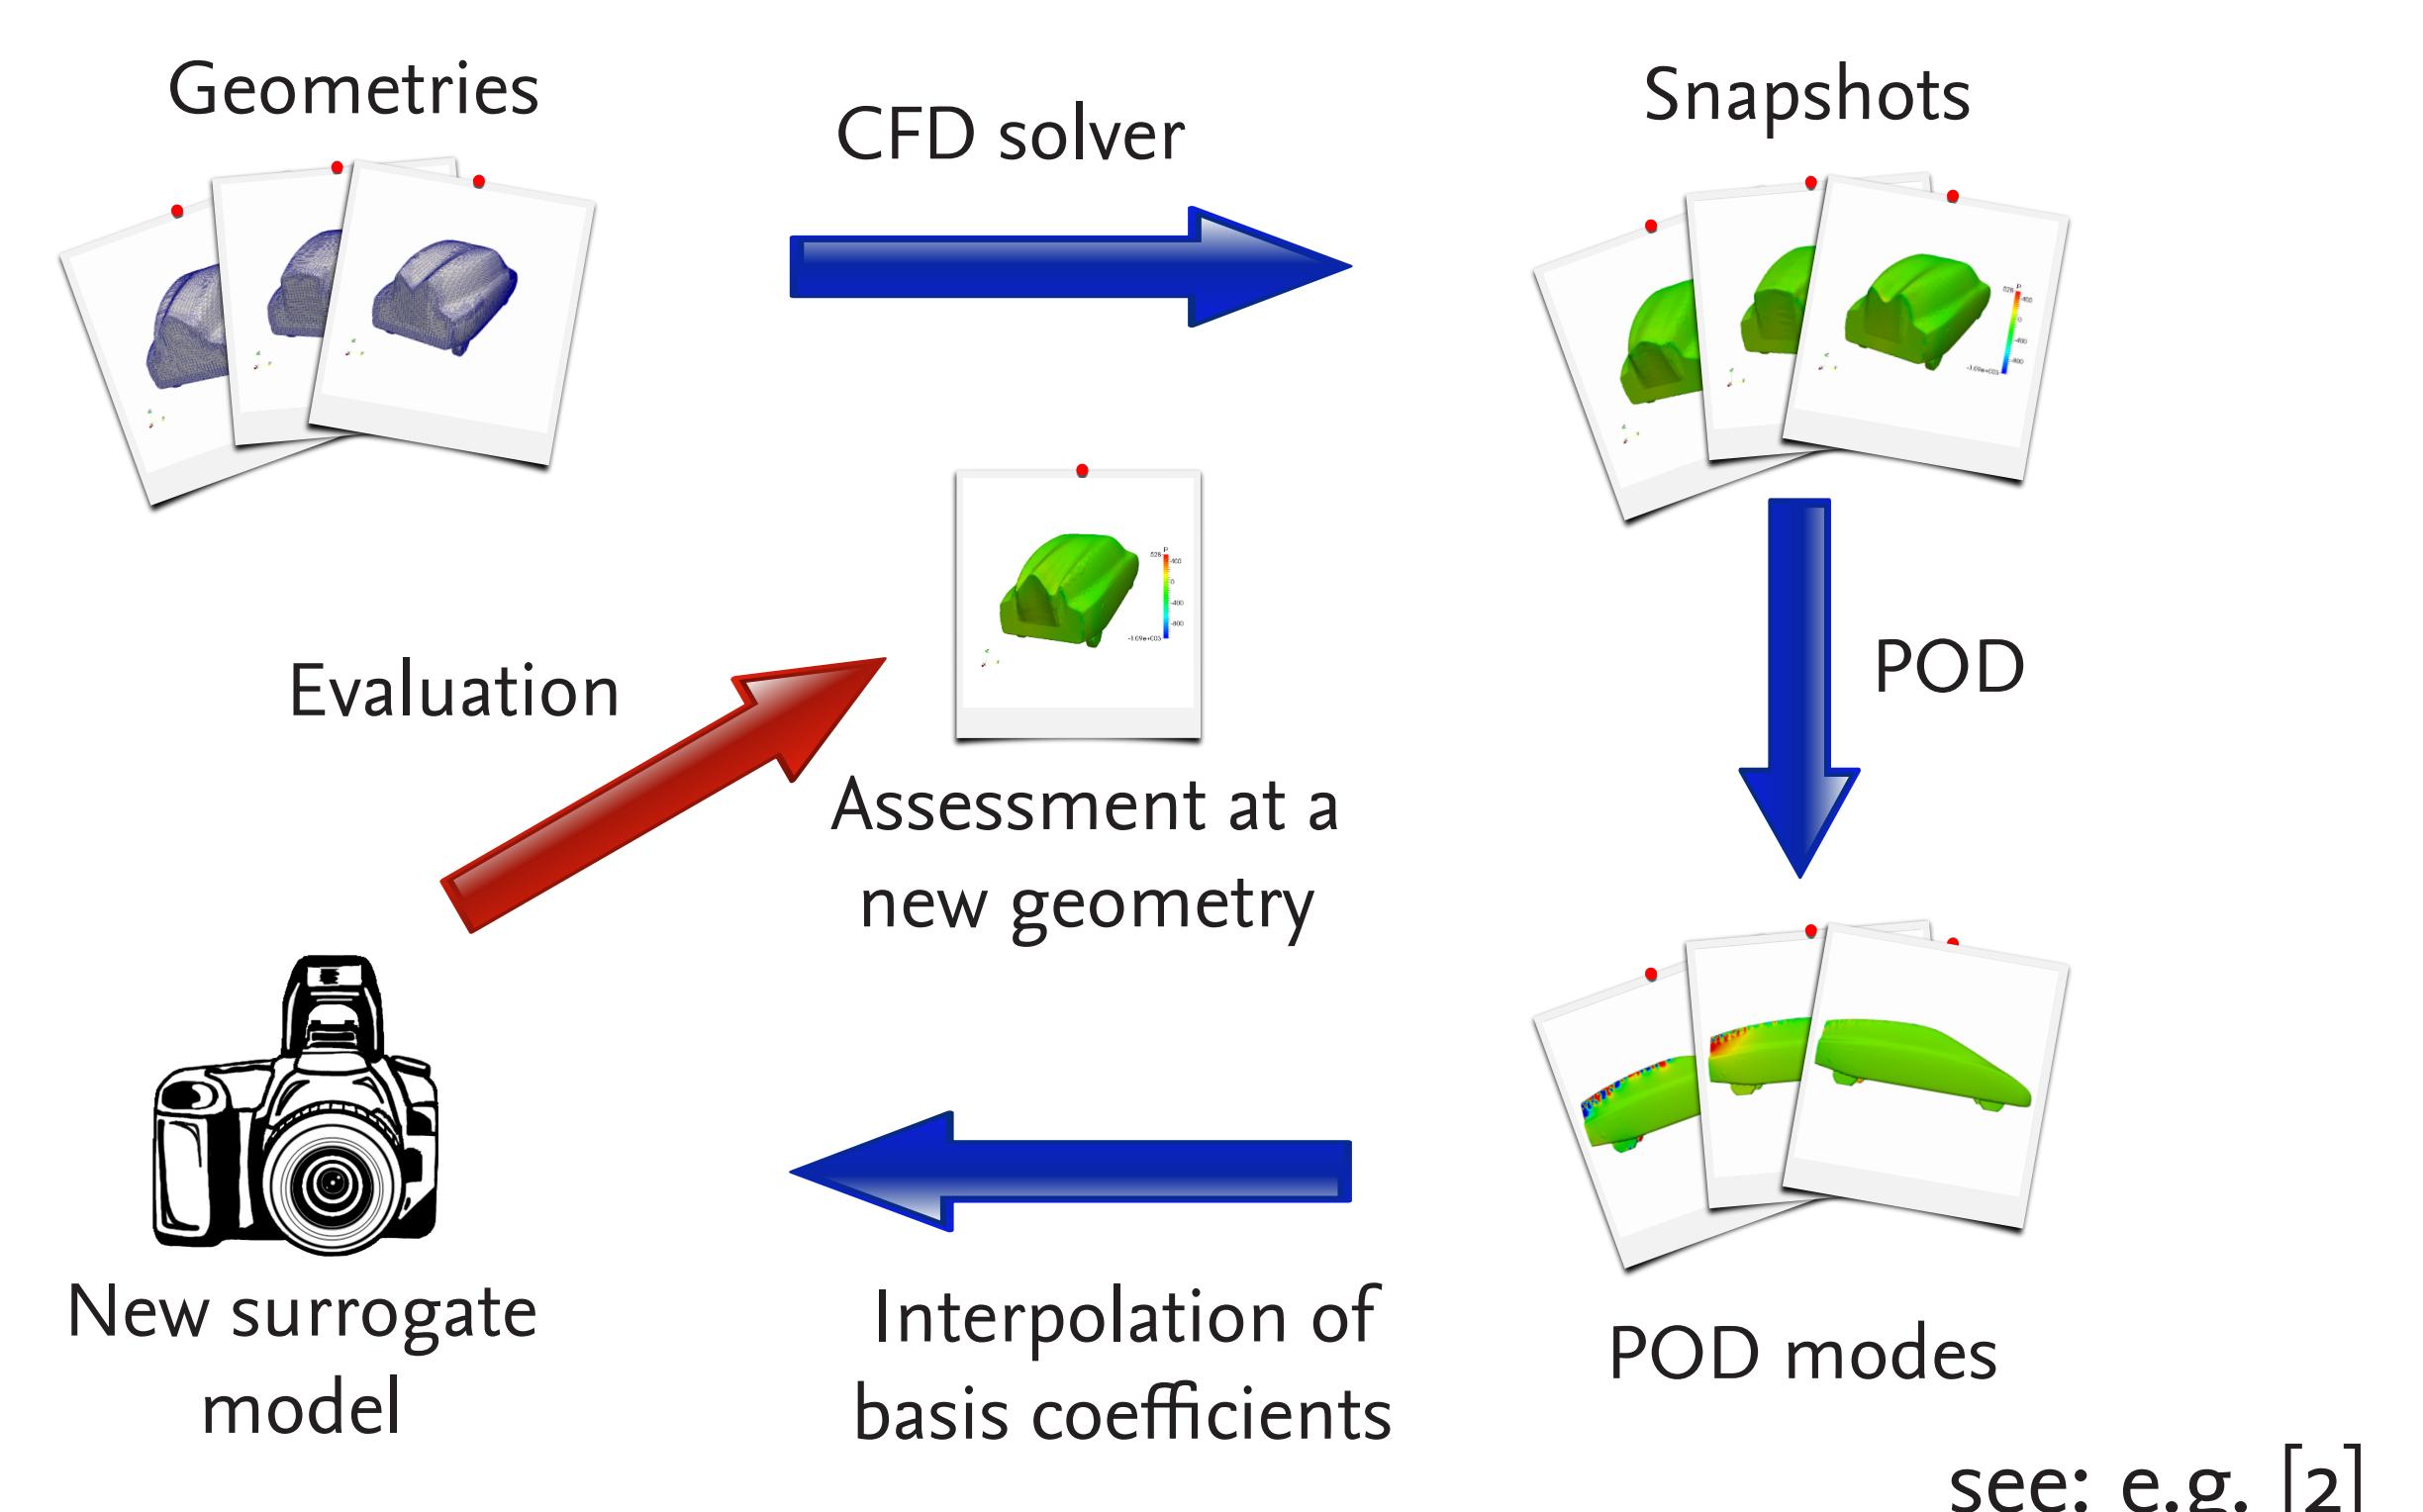

- Fit a Kriging model to the low-fidelity data
 - Use this model as a regression function for the Kriging interpolation of the high-fidelity data

see: [1]

Example for Hierarchical Kriging

Combining POD and interpolation

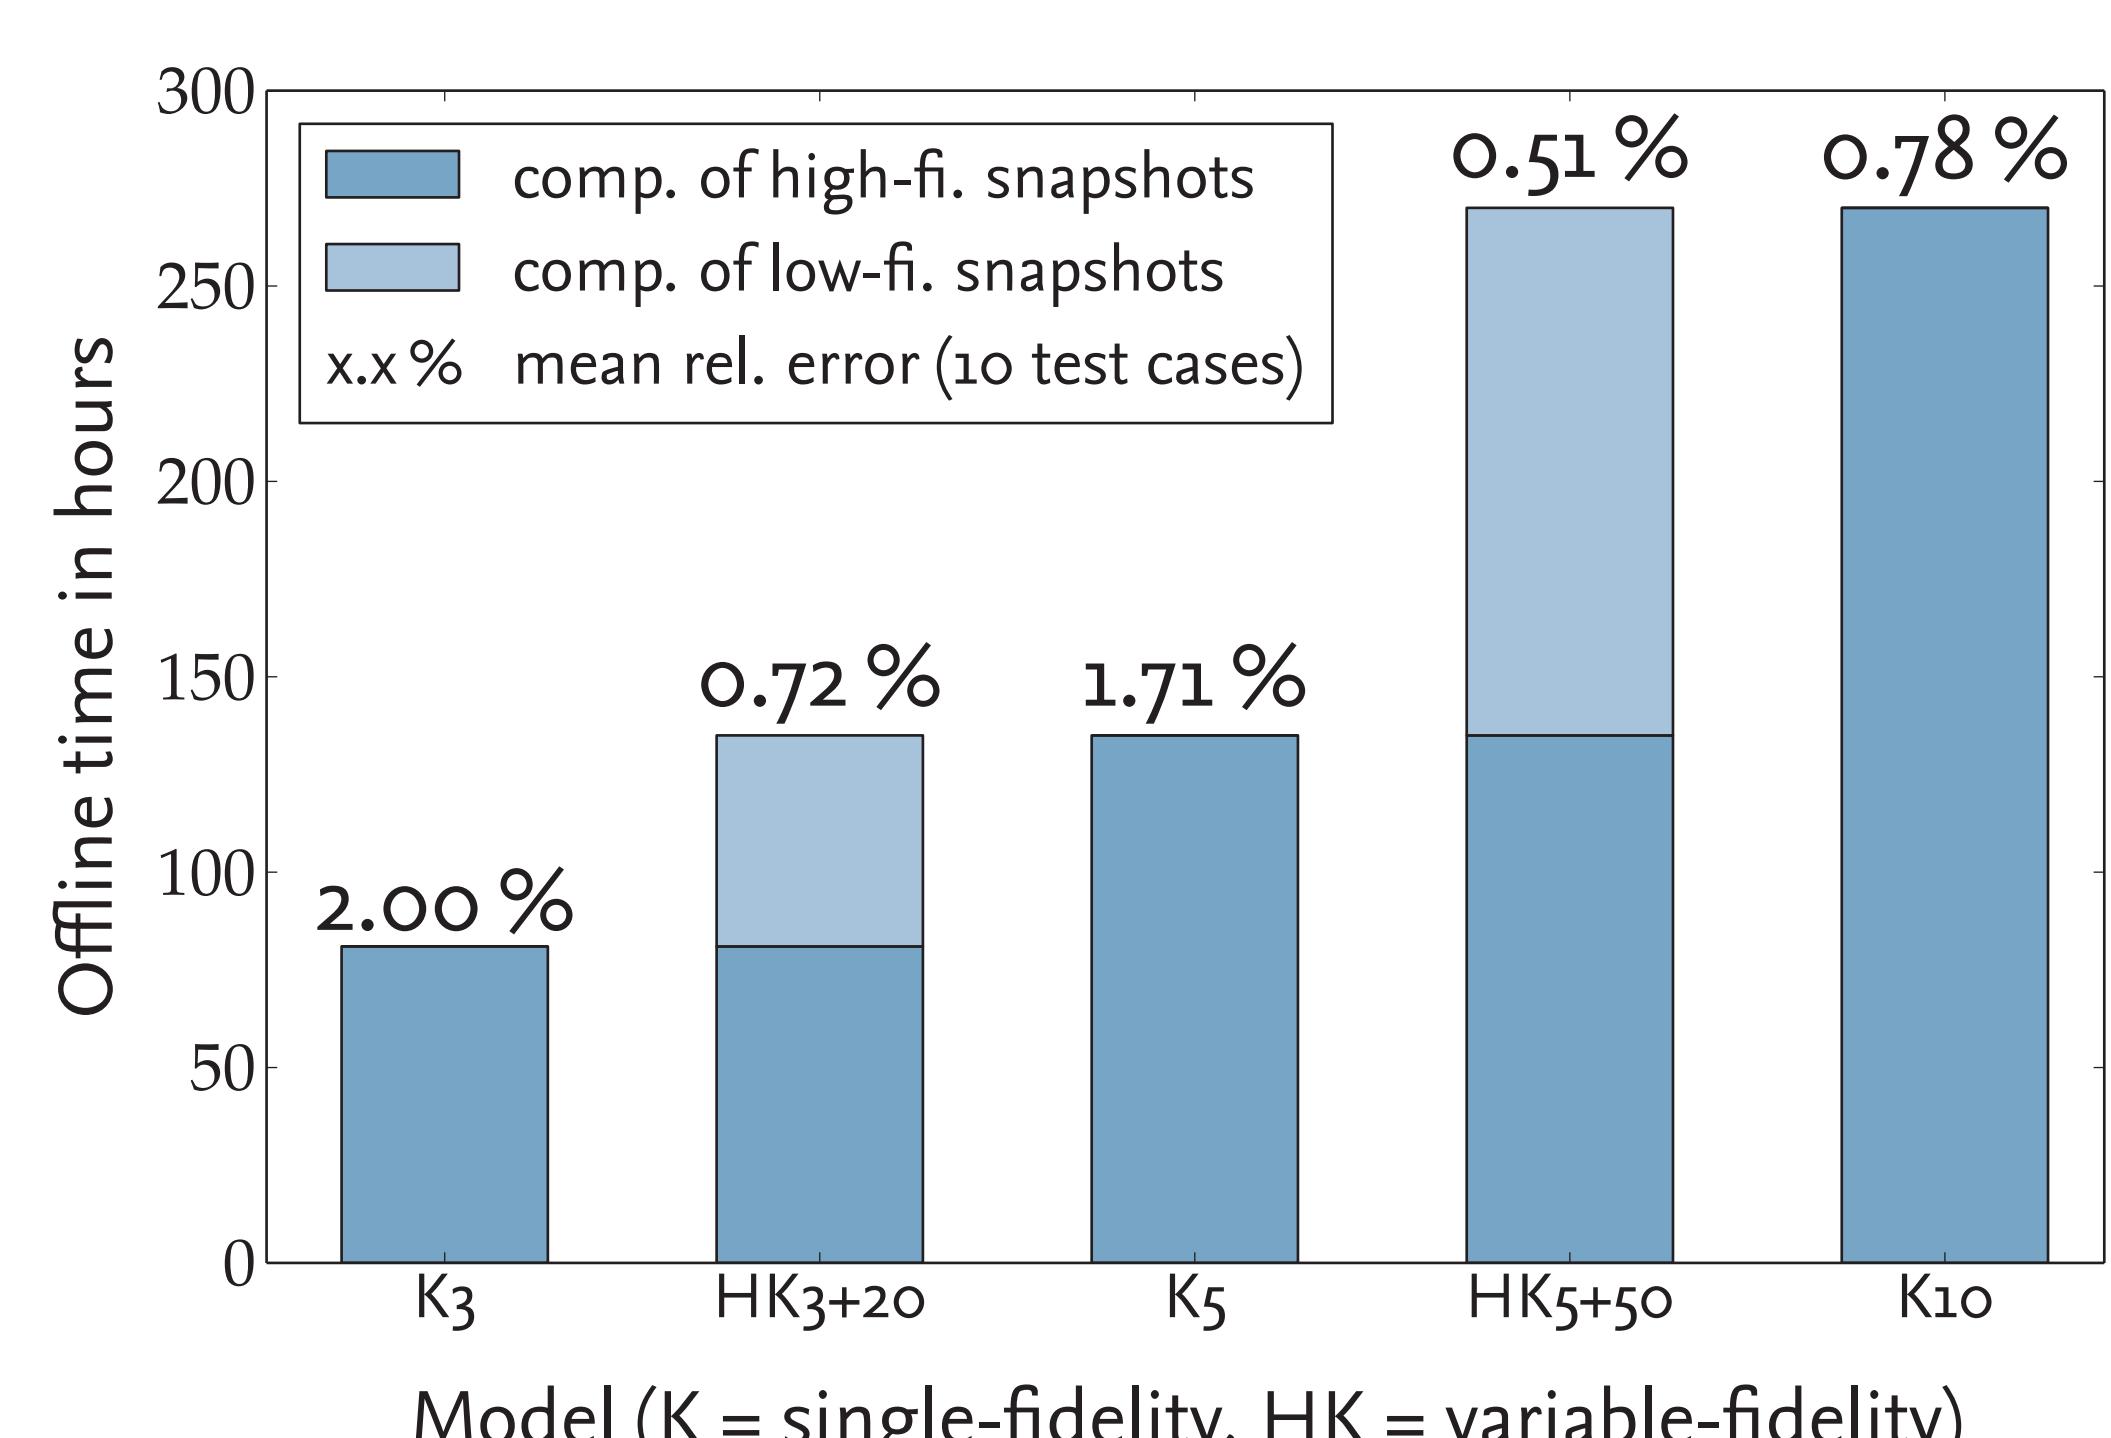

Industrial test case

VW Passat B6, 5 design param. at the rear, realistic deform. of + 2 cm

- 404603 cells
 - inflow velocity: $33.33 \frac{m}{s}$
 - high-fi. CFD sim.: 27 h
 - low-fi. CFD sim.: 2.7 h

Objective: Approx. of the pressure distribution onto the cars body
