

EXAMINATION PAPER

Examination Session: May	Year: 2017	Exam Code: MATH3291-WE01
------------------------------------	----------------------	------------------------------------

Title: Partial Differential Equations III

Time Allowed:	3 hours	
Additional Material provided:	None	
Materials Permitted:	None	
Calculators Permitted:	Yes	Models Permitted: Casio fx-83 GTPLUS or Casio fx-85 GTPLUS.
Visiting Students may use dictionaries: No		

Instructions to Candidates:	Credit will be given for: the best FOUR answers from Section A and the best THREE answers from Section B. Questions in Section B carry TWICE as many marks as those in Section A.	
		Revision:

SECTION A

1. Consider the conservation law

$$\begin{aligned} u_t + uu_x &= 0 & \text{for } (x, t) \in \mathbb{R} \times (0, T), \\ u(x, 0) &= e^{-x^4} & \text{for } x \in \mathbb{R}. \end{aligned} \tag{1}$$

- (a) Find the largest value of $T \in \mathbb{R}$ for which this conservation law has a classical solution $u : \mathbb{R} \times [0, T) \rightarrow \mathbb{R}$.
- (b) Give a sketch of the characteristics of (1) up until time T .
- (c) State what it means for u to be a weak solution of (1).
2. Let $c, u_0 \in C^1(\mathbb{R})$, u_0 be bounded, and $u'_0(x) \rightarrow 0$ as $x \rightarrow \pm\infty$. Define

$$I := \{s \in \mathbb{R} : c(u_0(s))_s < 0\}.$$

Assume that I is nonempty. Let $s_c \in I$ satisfy

$$\frac{-1}{c'(u_0(s_c))u'_0(s_c)} = \min_{s \in I} \frac{-1}{c'(u_0(s))u'_0(s)} =: t_c.$$

Let $\tilde{s} : \mathbb{R} \times [0, t_c) \rightarrow \mathbb{R}$ be the unique function satisfying $x = \tilde{s}(x, t) + c(u_0(\tilde{s}(x, t)))t$.

- (a) State the solution of the conservation law

$$\begin{aligned} u_t + c(u)u_x &= 0 & \text{for } (x, t) \in \mathbb{R} \times (0, t_c), \\ u(x, 0) &= u_0(x) & \text{for } x \in \mathbb{R}. \end{aligned}$$

(You do not need to derive the solution.)

- (b) Define $x_c(t) = s_c + c(u_0(s_c))t$. Prove that

$$\lim_{t \rightarrow t_c^-} |u_t(x_c(t), t)| = \infty.$$

- (c) Show that u satisfies the implicit equation

$$u(x, t) = u_0(x - c(u(x, t))t).$$

3. Consider Poisson's equation in one dimension with Neumann boundary conditions:

$$-u''(x) = f(x), \quad x \in (a, b), \quad (2)$$

$$u'(a) = 0, \quad u'(b) = 0, \quad (3)$$

where $f \in C([a, b])$.

(a) Show that a necessary condition for (2), (3) to have a solution is

$$\int_a^b f(x) dx = 0. \quad (4)$$

(b) Assume that f satisfies (4). Find the unique solution of (2), (3) satisfying $u(a) = 0$. Write your solution in the form

$$u(x) = \int_a^b G(x, y) f(y) dy.$$

4. Consider the elliptic boundary value problem

$$-(|u'|^{p-2}u')' + \gamma u = 0, \quad x \in (0, 2\pi), \quad (5)$$

$$u(0) = u(2\pi) = 0, \quad (6)$$

where $p \geq 2$ and $\gamma \in \mathbb{R}$ are constants.

(a) Let $\gamma \geq 0$. Show that (5), (6) has a unique solution.

(b) Now consider the case $p = 2$, $\gamma < 0$. Find a sequence $\{\gamma_n\}_{n=1}^\infty$, with $\gamma_n < 0$ and $\gamma_n \neq \gamma_m$ for $n \neq m$, such that, for each $n \in \mathbb{N}$, the following boundary value problem has infinitely many solutions:

$$-u'' + \gamma_n u = 0, \quad x \in (0, 2\pi),$$

$$u(0) = u(2\pi) = 0.$$

5. Let $\Omega \subset \mathbb{R}^2$ be open and bounded with smooth boundary. Define $E : C^1(\bar{\Omega}) \rightarrow \mathbb{R}$ by

$$E[v] = \int_{\Omega} \sqrt{1 + |\nabla v|^2} d\mathbf{x}.$$

Let $g : \partial\Omega \rightarrow \mathbb{R}$ be a given smooth function and let

$$V = \{\varphi \in C^1(\bar{\Omega}) : \varphi = g \text{ on } \partial\Omega\}.$$

Suppose that $u \in C^2(\bar{\Omega}) \cap V$ minimises E over V :

$$E[u] = \min_{v \in V} E[v].$$

Show that u satisfies the minimal surface equation

$$\operatorname{div} \left(\frac{\nabla u}{\sqrt{1 + |\nabla u|^2}} \right) = 0 \quad \text{in } \Omega.$$

6. Let $c \in \mathbb{R}$, $k > 0$ be constants.

(a) Recall that the inverse Fourier transform of a function $h \in L^1(\mathbb{R})$ is defined by

$$\check{h}(x) = \frac{1}{\sqrt{2\pi}} \int_{-\infty}^{\infty} h(\xi) e^{ix\xi} d\xi.$$

For $t > 0$, define $f \in L^1(\mathbb{R})$ by

$$f(\xi) = \exp\left(-(k\xi^2 + ic\xi)t\right).$$

Prove that

$$\check{f}(x) = \frac{1}{\sqrt{2kt}} \exp\left(-\frac{1}{4kt}(x - ct)^2\right).$$

You may use the following, which you do not need to prove: For $a > 0$,

$$\int_{\Gamma} e^{-az^2} dz = \int_{-\infty}^{\infty} e^{-ay^2} dy = \sqrt{\frac{\pi}{a}}$$

for all complex curves Γ of the form $\Gamma = \{x + ib : x \in (-\infty, \infty)\}$, $b \in \mathbb{R}$.

(b) Consider the transport-diffusion equation

$$u_t + cu_x = ku_{xx} \quad \text{for } (x, t) \in \mathbb{R} \times (0, \infty)$$

with initial condition $u(x, 0) = g(x)$ for $x \in \mathbb{R}$, where $g \in L^1(\mathbb{R}) \cap C(\mathbb{R})$. Use the Fourier transform and part (a) to derive the following solution:

$$u(x, t) = \frac{1}{\sqrt{4\pi kt}} \int_{-\infty}^{\infty} \exp\left(-\frac{(x - ct - y)^2}{4kt}\right) g(y) dy.$$

You may use the following properties of the Fourier transform, which you do not need to prove:

$$\widehat{f_1 * f_2} = \sqrt{2\pi} \hat{f}_1 \hat{f}_2, \quad \widehat{f^{(\alpha)}}(\xi) = (i\xi)^\alpha \hat{f}(\xi).$$

SECTION B

7. (i) Consider the Cauchy problem

$$xu_x(x, y) + yu_y(x, y) = 2u(x, y) \quad \text{for } x > 0, y \in \mathbb{R}, \quad (7)$$

$$u(x, y) = f(x, y) \quad \text{for } x^2 + y^2 = 1, x > 0. \quad (8)$$

- (a) Use the method of characteristics to derive the solution u in terms of f .
 (b) Now consider the Cauchy problem

$$xu_x(x, y) + yu_y(x, y) = 2u(x, y) \quad \text{for } x > 0, y \in \mathbb{R}, \quad (9)$$

$$u(x, 0) = x^2 \quad \text{for } x > 0. \quad (10)$$

Use part (a) to show that the Cauchy problem (9), (10) has infinitely many solutions. Explain why this does not contradict the local existence and uniqueness theorem for first-order quasilinear PDEs.

- (ii) (a) Let $u : \mathbb{R} \times [0, \infty) \rightarrow [0, \infty)$ be a smooth function satisfying the scalar conservation law

$$u_t + f(u)_x = 0 \quad \text{for } (x, t) \in \mathbb{R} \times (0, \infty),$$

where $f(u) = \frac{1}{2}u^2$. Define $v = u^2$. Show that v satisfies the scalar conservation law

$$v_t + g(v)_x = 0 \quad \text{for } (x, t) \in \mathbb{R} \times (0, \infty),$$

where $g(v) = \frac{2}{3}v^{\frac{3}{2}}$.

- (b) Let

$$u_0(x) = \begin{cases} u_l & \text{if } x < 0, \\ u_r & \text{if } x > 0, \end{cases}$$

where u_l and u_r are constants with $u_l > u_r$. The weak solution of the conservation law

$$u_t + f(u)_x = 0 \quad \text{for } (x, t) \in \mathbb{R} \times (0, \infty),$$

$$u(x, 0) = u_0(x) \quad \text{for } x \in \mathbb{R}$$

is

$$u(x, t) = \begin{cases} u_l & \text{if } x < \frac{1}{2}(u_l + u_r)t, \\ u_r & \text{if } x > \frac{1}{2}(u_l + u_r)t. \end{cases}$$

Let $v_0 = u_0^2$. Find the weak solution of the conservation law

$$v_t + g(v)_x = 0 \quad \text{for } (x, t) \in \mathbb{R} \times (0, \infty),$$

$$v(x, 0) = v_0(x) \quad \text{for } x \in \mathbb{R}.$$

Does $v = u^2$?

8. Consider the scalar conservation law

$$\begin{aligned} u_t + f(u)_x &= 0 & \text{for } (x, t) \in \mathbb{R} \times (0, \infty), \\ u(x, 0) &= u_0(x) & \text{for } x \in \mathbb{R}, \end{aligned} \quad (11)$$

where $f(u) = \frac{1}{4}u^4$ and

$$u_0(x) = \begin{cases} 0 & \text{if } x < 0, \\ 2 & \text{if } x > 0. \end{cases}$$

- (a) Write down the equations of the characteristics (you do not need to derive them from first principles). Sketch the characteristics.
- (b) Verify that the following is a weak solution of (11):

$$u(x, t) = \begin{cases} 0 & \text{if } x < \frac{1}{4}u_m^3 t, \\ u_m & \text{if } \frac{1}{4}u_m^3 t < x < u_m^3 t, \\ \left(\frac{x}{t}\right)^{\frac{1}{3}} & \text{if } u_m^3 t \leq x \leq 8t, \\ 2 & \text{if } x > 8t, \end{cases}$$

where u_m is any constant satisfying $0 < u_m < 2$.

- (c) Does the solution in part (b) satisfy the Lax entropy condition? Justify your answer.
- (d) Find a class of weak solutions of (11) with two rarefaction waves and one shock.

9. Let $\Omega \subset \mathbb{R}^2$ be open and bounded. Let $u \in C^2(\Omega) \cap C(\overline{\Omega})$ satisfy

$$-\Delta u + \mathbf{b} \cdot \nabla u = f \quad \text{in } \Omega,$$

where $\mathbf{b} : \Omega \rightarrow \mathbb{R}^2$, $f : \Omega \rightarrow \mathbb{R}$ are continuous.

(a) Assume that $f < 0$. Prove the following weak maximum principle:

$$\max_{\overline{\Omega}} u = \max_{\partial\Omega} u.$$

Hint: You cannot prove this using a mean-value formula. Imitate the proof of the weak maximum principle for the heat equation.

(b) Now assume $\mathbf{b} = 0$ and $f \leq 0$. Use part (a) to prove that

$$\max_{\overline{\Omega}} u = \max_{\partial\Omega} u.$$

Hint: Consider functions of the form $u_\varepsilon(\mathbf{x}) = u(\mathbf{x}) - \varepsilon(R^2 - |\mathbf{x}|^2)$ for $\varepsilon > 0$ and $R > 0$ such that $\Omega \subset B_R(\mathbf{0})$.

(c) Now assume $\mathbf{b} = 0$ and $f > 0$. Give an example of $\Omega \subset \mathbb{R}^2$, $u \in C^2(\Omega) \cap C(\overline{\Omega})$, and $f \in C(\Omega)$ such that

$$\max_{\overline{\Omega}} u \neq \max_{\partial\Omega} u.$$

(d) For $i \in \{1, 2\}$, let $u_i \in C^2(\Omega) \cap C(\overline{\Omega})$ satisfy

$$\begin{aligned} -\Delta u_i + \mathbf{b} \cdot \nabla u_i &= f_i \quad \text{in } \Omega, \\ u_i &= g_i \quad \text{on } \partial\Omega, \end{aligned}$$

where $\mathbf{b} : \Omega \rightarrow \mathbb{R}^2$, $f_i : \Omega \rightarrow \mathbb{R}$, $g_i : \partial\Omega \rightarrow \mathbb{R}$ are continuous.

Show that if $f_2 > f_1$ and $g_2 > g_1$, then $u_2 > u_1$.

10. Let $k > 0$ be a constant and let $u : [a, b] \times [0, \infty) \rightarrow \mathbb{R}$ be a smooth function satisfying the heat equation

$$\begin{aligned} u_t(x, t) - ku_{xx}(x, t) &= f(x) \quad \text{for } (x, t) \in (a, b) \times (0, \infty), \\ u(x, 0) &= u_0(x) \quad \text{for } x \in (a, b), \\ u_x(a, t) = u_x(b, t) &= 0 \quad \text{for } t \in [0, \infty), \end{aligned}$$

where u_0 and f are smooth functions and $\int_a^b f(x) dx = 0$. Let $v : [a, b] \rightarrow \mathbb{R}$ be the unique solution of

$$\begin{aligned} -kv_{xx}(x) &= f(x) \quad \text{for } x \in (a, b), \\ v_x(a) = v_x(b) &= 0, \\ \int_a^b v(x) dx &= \int_a^b u_0(x) dx. \end{aligned}$$

Define $w(x, t) = u(x, t) - v(x)$.

- (a) Prove the following version of the Grönwall inequality: If $E : [0, \infty) \rightarrow \mathbb{R}$ satisfies $\dot{E} \leq -\lambda E$ for some constant $\lambda \in \mathbb{R}$, then $E(t) \leq e^{-\lambda t} E(0)$.
- (b) Prove that w satisfies

$$\frac{d}{dt} \int_a^b w^2(x, t) dx = -2k \int_a^b w_x^2(x, t) dx.$$

- (c) Prove that

$$\int_a^b u(x, t) dx = \int_a^b u_0(x) dx \quad \forall t \geq 0.$$

- (d) Prove that $w \rightarrow 0$ in $L^2([a, b])$ as $t \rightarrow \infty$.
- (e) Similarly, it can be shown that $w_x \rightarrow 0$ in $L^2([a, b])$ as $t \rightarrow \infty$ (you do not need to show this). Prove that $w \rightarrow 0$ in $L^\infty([a, b])$ as $t \rightarrow \infty$.
