- Nonlinear EVP in practice, 3D elastic field near crack Numerical Methods for nonlinear EVP's
- Linearization

Numerical methods for linear generalized evp's Conclusions

The analysis of the dynamical/acoustic behavior of structures, vehicles, or molecules needs the numerical solution of nonlinear eigenvalue problems.

- Such systems have been solved for decades!
- The mathematics is well-known and used in industrial engineering every day!
- The numerical methods are available in (commercial) software!
- We just buy bigger computers to handle the higher complexity?
- Do we still need to talk about it?
- Do we need improved numerical methods?
- What are the challenges?

イロト イヨト イヨト イヨ

- Society is increasingly sensitive to inconveniences that come with modern technologies such as pollution and noise.
- There is an increasing demand for optimal solutions. Minimal energy consumption, minimal noise, pollution, waste.
- Optimal solutions need mathematical techniques, such as model based optimization/optimal control.
- We need better mathematical models, faster and more accurate numerical methods, robust implementations on modern computer architectures.
- The progress through better methods exceeds the progress through better hardware by large factors.

## Infinite dimensional second order system

Under the assumption of an infinite rail, FEM in space leads to the second order system

$$\mathcal{M}\ddot{z}+\mathcal{D}\dot{z}+\mathcal{K}z=\mathcal{F},$$

with symmetric infinite block tridiagonal coefficient matrices (operators)  $\mathcal{M}, \mathcal{D}, \mathcal{K}$ , where

$$\mathcal{M} = \begin{bmatrix} \ddots & \ddots & 0 & \dots & 0 \\ \ddots & M_{j-1,0} & M_{j,1} & 0 & \dots \\ 0 & M_{j,1}^T & M_{j,0} & M_{j+1,1} & 0 \\ \vdots & \ddots & M_{j+1,1}^T & M_{j+1,0} & M_{j+2,1} \\ 0 & \dots & 0 & \ddots & \ddots \end{bmatrix} z = \begin{bmatrix} \vdots \\ z_{j-1} \\ z_j \\ z_{j+1} \\ \vdots \end{bmatrix},$$

Operators  $\mathcal{D}, \mathcal{K}$  have the same structure. Furthermore,  $M_{j,0} > 0$ ,  $D_{j,0}, K_{j,0} \ge 0$ .

#### Fourier expansion

$$F_j = \hat{F}_j e^{i\omega t}, \ z_j = \hat{z}_j e^{i\omega t},$$

where  $\omega$  is the excitation frequency. Using periodicity and combining  $\ell$  parts into one vector

$$y_j = \begin{bmatrix} \hat{z}_j^T & \hat{z}_{j+1}^T & \dots & \hat{z}_{j+\ell}^T \end{bmatrix}^T$$

gives a (singular) difference equation

$$\boldsymbol{A}_{1}(\boldsymbol{\omega})\boldsymbol{y}_{j+1} + \boldsymbol{A}_{0}(\boldsymbol{\omega})\boldsymbol{y}_{j} + \boldsymbol{A}_{1}(\boldsymbol{\omega})^{T}\boldsymbol{y}_{j-1} = \boldsymbol{G}_{j}.$$

with  $A_0(\omega) = A_0^T(\omega)$  block tridiagonal and  $A_1(\omega)$  singular of rank smaller than n/2.

Ansatz  $y_{j+1} = \kappa y_j$ , leads to the large scale rational eigenvalue problem

$$\mathcal{R}(\kappa) x = (\kappa \mathcal{A}_1(\omega) + \mathcal{A}_0(\omega) + \frac{1}{\kappa} \mathcal{A}_1(\omega)^T) x = 0.$$

Alternative representation as so called **palindromic** polynomial eigenvalue problem

$$P(\lambda)x = (\lambda^2 A_1(\omega) + \lambda A_0(\omega) + A_1(\omega)^T)x = 0.$$

- < AB > < B > < B >

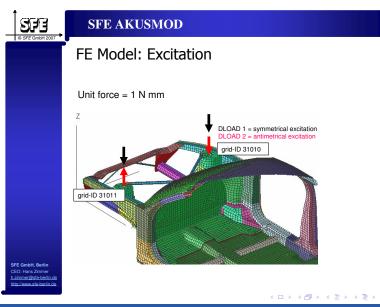

- ▷ Large scale nonlinear structured eigenvalue problem.
- All (commercial/non-commercial) methods failed (no correct digits in double precision).
- Many infinite and zero eigenvalues, structured deflation necessary (second talk).
- ▷ Effective use of structure (second talk).
- ightarrow  $\rightarrow$  film.

## Introduction Nonlinear EVP in practice, fast trains Nonlinear EVP in practice, car acoustics Nonlinear EVP in practice, 3D elastic field near crack Numerical Methods for nonlinear EVP's Linearization Numerical methods for linear generalized evp's Conclusions

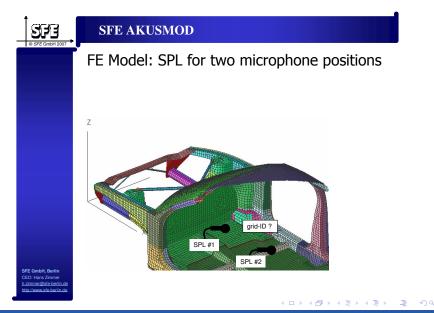

#### Nonlinear eigenvalue problems in practice

## **Optimization problem**

- ▷ Parameterized FEM model for car body, as well as air in car.
- Geometry and topology changes lead ad hoc to new linear systems/eigenvalue problems (up to size 10,000,000).
- ▷ Goal: Minimize noise in important regions in car interior.

**Tasks:** Numerical methods for large scale (complex symmetric) linear systems (frequency response) and eigenvalue problems (model reduction, modal analysis, optimization of frequencies).

Solve  $P(\omega)u(\omega) = f(\omega)$ , for  $\omega = 0 - 1000hz$ , where

$$\boldsymbol{P}(\omega) := -\omega^2 \begin{bmatrix} \boldsymbol{M}_s & \boldsymbol{0} \\ \boldsymbol{0} & \boldsymbol{M}_f \end{bmatrix} + \imath \omega \begin{bmatrix} \boldsymbol{D}_s & \boldsymbol{D}_{as}^T \\ \boldsymbol{D}_{as} & \boldsymbol{D}_f \end{bmatrix} + \begin{bmatrix} \boldsymbol{K}_s(\omega) & \boldsymbol{0} \\ \boldsymbol{0} & \boldsymbol{K}_f \end{bmatrix},$$

is complex symmetric of dimension up to 10,000,000 and

 $\triangleright$   $M_s, M_f, K_f$  are real symm. pos. semidef. mass/stiffness matrices of structure and air,  $M_s$  is singular and diagonal,  $M_f$  is sparse.

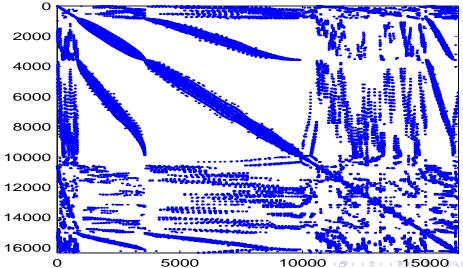

$$\triangleright \ \mathsf{K}_{\mathsf{s}}(\omega) = \mathsf{K}_{\mathsf{s}}(\omega)^{\mathsf{T}} = \mathsf{K}_{\mathsf{1}}(\omega) + \imath \mathsf{K}_{\mathsf{2}}.$$

- $\triangleright$   $D_s$  is a real damping matrix,  $D_f$  is complex symmetric.
- $\triangleright$   $D_{as}$  is real coupling matrix between structure and air.
- All matrices depend on geometry, topology and material parameters.

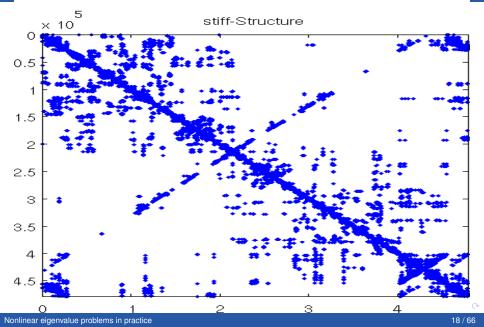

## Sparsity of fluid mass matrix $M_f$

mass-fluid

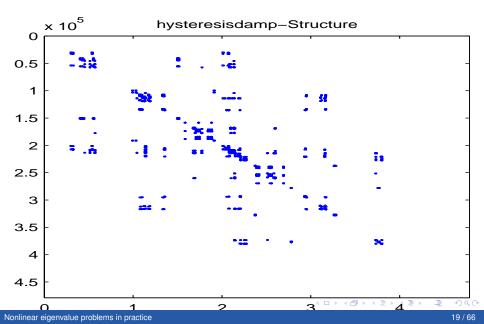

## Sparsity of $K_1(\omega)$

Sparsity of K<sub>2</sub>

Compute smallest real eigenvalues and associated eigenvectors of  $P(\lambda)x = 0$ , where the matrix polynomial

$$P(\lambda) := \lambda^2 \begin{bmatrix} M_s & 0 \\ 0 & M_f \end{bmatrix} + \lambda \begin{bmatrix} D_s & D_{as}^T \\ D_{as} & D_f \end{bmatrix} + \begin{bmatrix} K_s & 0 \\ 0 & K_f \end{bmatrix},$$

is **complex symmetric** and has dimension up to 10,000,000. Tasks:

- Project the problem into the subspace spanned by these eigenvectors.
- ▷ Solve the second order differential-algebraic system (DAE).
- ▷ Optimize the eigenfrequencies w.r.t. the set of parameters.

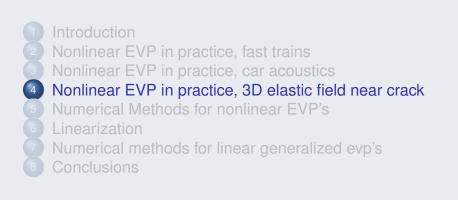

- Large scale nonlinear (complex symmetric) eigenvalue problem arising from coupled FEM models for structure/fluid.
- Problem contains parameters to be optimized.
- Eigenvalue path following.
- ▷ Homotopy from undamped to damped problem.
- ▷ Shift-and-invert Lanczos/Arnoldi/Jacobi Davidson.
- Subspace recycling (warm restarts).
- ▷ Model reduction for optimization (third talk).
- We should really use adaptive FEM for eigenvalue problem. (Not much theory and no code for non-elliptic problems).

A (10) > A (10) > A (10)

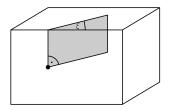

Near a singularity, the displacement field U of an elastic body can be expanded (Kondrat'ev 1967), as

 $\gamma \mathbf{r}^{\boldsymbol{\alpha}} \mathbf{u}(\phi, \theta),$ 

where  $\gamma$  is the stress intensity factor and  $u(\phi, \theta)$  is angular part of *U* in spherical coordinates.

Example: Crack in 3D Domain  $\Omega$ 

The singular exponent  $\alpha$ , (changed to  $\lambda = \alpha + 1/2$ ) satisfies the operator evp:

$$\lambda^2 m(u, v) + \lambda g(u, v) - k(u, v) = 0,$$

with sesquilinear forms

$$egin{array}{rcl} m(u,v) &=& m(v,u), \ g(u,v) &=& -g(v,u), \ k(u,v) &=& k(v,u). \end{array}$$

< □ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

Take continuous functions from  $V_0$  which are piecewise linear on a triangular finite element mesh  $T_h$ . With

$$\lambda_h \in \mathbb{C}, \quad u_h \in V_{0h} \setminus \{\mathbf{0}\}$$

we have a finite dimensional problem

$$\lambda_h^2 m(u_h, v_h) + \lambda_h g(u_h, v_h) - k(u_h, v_h) = 0 \quad \forall v_h \in V_{0h}$$

and with appropriate FEM bases, a so called even quadratic evp

$$P(\lambda)u = \lambda^2 M u + \lambda G u - K u = 0,$$

with  $M = M^T > 0$ ,  $G = -G^T$ ,  $K = K^T > 0$ .

< A > < A > >

#### Theorem (Karma 1996)

Consider an eigenpair  $(\lambda, u)$ . Let  $\kappa$  be the maximal size of an associated Jordan block. For a sequence of eigenpairs  $\{(\lambda_h, u_h)\}_{h\to 0}$  with  $\lambda_h \to \lambda_0$  the estimates

$$\begin{aligned} |\lambda_0 - \lambda_h| &\leq Ch^{2/\kappa}, \\ \|u_0 - u_h\|_V &\leq Ch^{\nu}, \quad \nu = \min\{1, 2/\kappa\} \end{aligned}$$

hold.

#### Theorem (Karma 1996)

For an eigenvalue  $\lambda_0$  with algebraic multiplicity m there exist m disjoint sequences  $\{\lambda_{h,i}\}$  with  $\lambda_{h,i} \rightarrow \lambda_0$ , i = 1, ..., m. Then for the arithmetic mean  $\hat{\lambda}_h := \frac{1}{m} \sum_{i=1}^m \lambda_{h,i}$  the improved estimate

$$|\lambda_0 - \hat{\lambda}_h| \leq Ch^2$$

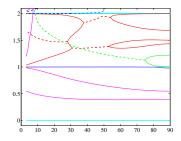

holds.

# Introduction Nonlinear EVP in practice, fast trains Nonlinear EVP in practice, car acoustics Nonlinear EVP in practice, 3D elastic field near crack Numerical Methods for nonlinear EVP's Linearization Numerical methods for linear generalized evp's Conclusions

- For polynomial/rational eigenvalue problems, use linearization to turn problem into a larger linear evp.
- Apply the known methods for the linear evp, Lanczos, Arnoldi, Jacobi-Davidson, inverse iteration, ...
- For genuine nonlinear problems there are several approaches, all variations of Newton's method. None of them is global and robust.
- Many open problems

For surveys see M./Voss 2005 or Dissertation Schreiber 2008.

- Second order Arnoldi method Bai 2006
- Rational Krylov method Ruhe 1998, 2000
- Residual iteration method Neumaier 1985
- Newton methods Schreiber/Schwetlick 2006, 2008,
- Rayleigh quotient iterations Schreiber 2008, Freitag/Spence 2007, 2008
- Jacobi-Davidson method Sleijpen/Van der Vorst et al 1996, Betcke/Voss 2004, Hochstenbach 2007
- Arnoldi type methods Voss 2003

▷ ...

Only few of these methods make use of structure (second talk), convergence theory and preconditioning needs more analysis.

### Newton's method

For nonlinear EVP  $\mathcal{F}(\lambda)x = 0$  consider nonlinear problem

$$\begin{bmatrix} \mathcal{F}(\lambda)x \\ v^{H}x - 1 \end{bmatrix} = \mathbf{0},$$

with some normalization vector v. One Newton step gives

$$\begin{bmatrix} \mathcal{F}(\lambda_k) & \mathcal{F}'(\lambda_k) \mathbf{X}_k \\ \mathbf{v}^H & \mathbf{0} \end{bmatrix} \begin{bmatrix} \mathbf{X}_{k+1} - \mathbf{X}_k \\ \lambda_{k+1} - \lambda_k \end{bmatrix} = -\begin{bmatrix} \mathcal{F}(\lambda_k) \mathbf{X}_k \\ \mathbf{v}^H \mathbf{X}_k - \mathbf{1} \end{bmatrix}.$$

The first component yields

$$\mathbf{x}_{k+1} = -(\lambda_{k+1} - \lambda_k)\mathcal{F}(\lambda_k)^{-1}\mathcal{F}'(\lambda_k)\mathbf{x}_k,$$

i.e. the direction of the new approximation is  $u_{k+1} := \mathcal{F}(\lambda_k)^{-1} \mathcal{F}'(\lambda_k) x_k$ . Assuming that  $v^H x_k = 1$ , we get

$$\lambda_{k+1} = \lambda_k - \frac{\mathbf{v}^H \mathbf{x}_k}{\mathbf{v}^H \mathbf{u}_{k+1}}.$$

- For simple eigenvalues Newton's method converges locally quadratically Anselone/Rall 68,Osborne 64.
- One needs very good starting values.
- ▷ No guarantee that one gets the desired eigenvalues.
- ▷ No direct use of special structures.
- Many matrix factorizations are needed.

## Variation of Newton's method

Change normalization vector v in each step to  $v_k = \mathcal{F}(\lambda_k)^H y_k$ , where  $y_k$  is an approximation of a left eigenvector. Then one gets

$$\lambda_{k+1} = \lambda_k - \frac{\mathbf{y}_k^H \mathcal{F}(\lambda_k) \mathbf{x}_k}{\mathbf{y}_k^H \mathcal{F}'(\lambda_k) \mathbf{x}_k},$$

which is a generalized Rayleigh functional Lancaster 2002. This is a Newton step for

$$f_k(\lambda) := y_k^H \mathcal{F}(\lambda) x_k = 0.$$

 For linear Hermitian eigenproblems, cubic convergence Crandall 51, Ostrowski 58.

- ▷ Analysis for nonlinear symmetric eigenproblems Rothe 1989.
- ▷ More analysis in Schreiber 2008, Schreiber/Schwetlick 2008.

To avoid large number of factorizations, Neumaier 1995 suggested the residual inverse iteration. If  $\mathcal{F}(\lambda)$  is twice continuously differentiable, then

$$\begin{array}{rcl} \mathbf{x}_{k} - \mathbf{x}_{k+1} &=& \mathbf{x}_{k} + (\lambda_{k+1} - \lambda_{k})\mathcal{F}(\lambda_{k})^{-1}\mathcal{F}'(\lambda_{k})\mathbf{x}_{k} \\ &=& \mathcal{F}(\lambda_{k})^{-1}(\mathcal{F}(\lambda_{k}) + (\lambda_{k+1} - \lambda_{k})\mathcal{F}'(\lambda_{k}))\mathbf{x}_{k} \\ &=& \mathcal{F}(\lambda_{k})^{-1}\mathcal{F}(\lambda_{k+1})\mathbf{x}_{k} + \mathcal{O}(|\lambda_{k+1} - \lambda_{k}|^{2}). \end{array}$$

Neglect second order term and replace  $\lambda_k$  by fixed shift  $\sigma$ :

$$\mathbf{X}_{k+1} = \mathbf{X}_k - \mathcal{F}(\sigma)^{-1} \mathcal{F}(\lambda_{k+1}) \mathbf{X}_k.$$

Another variation of this idea is the method of successive linear problems of Ruhe 1973 which converges locally quadratically.

Set  $U_1 = [u]$  for starting vector u.

For *k* = 1, 2, . . .,

Solve nonlinear evp  $U_k^H F(\lambda) U_k c = 0$  for  $(\lambda, c)$ .

Set 
$$u = U_k c$$
,  $r = F(\lambda) u$ .

If 
$$\frac{\|r\|}{\|u\|} < \epsilon$$
 STOP

Compute *s* orthogonal to *u* from correction eq.

$$\left(I-\frac{\dot{F}(\lambda)uu^{H}}{u^{H}\dot{F}(\lambda)u}\right)F(\lambda)\left(I-uu^{H}\right)s=-r.$$

Set  $U_{k+1}$  to be the result of modified Gram-Schmidt applied to span( $U_k$ , s).

The advantage of JD is that it is often sufficient to solve the correction equation approximately.

- ▷ No guarantee that all desired eigenvalues are obtained.
- No guarantee to obtain desired relative residual?
- ▷ Methods are very sensitive to changes of parameters.
- Erratic convergence behavior?
- Locking and purging or deflation of converged eigenvalues?
- Code implementation ?
- Detailed analysis and comparison: Dissertation Schreiber 2008.

# In general, the situation is not satisfactory! If at all possible, linearization seems to be a more robust approach.

# Nonlinear EVP in practice, fast trains Nonlinear EVP in practice, car acoustics Nonlinear EVP in practice, 3D elastic field near crack Numerical Methods for nonlinear EVP's Linearization Numerical methods for linear generalized evp's

The classical companion linearization for polynomial eigenvalue problems

$$P(\lambda)x = \sum_{i=0}^{k} \lambda^{i} A_{i}x$$

is to introduce new variables

$$\mathbf{y}^{\mathsf{T}} = \begin{bmatrix} \mathbf{y}_1, \mathbf{y}_2, \dots, \mathbf{y}_k \end{bmatrix}^{\mathsf{T}} = \begin{bmatrix} \mathbf{x}, \lambda \mathbf{x}, \dots, \lambda^{k-1} \mathbf{x} \end{bmatrix}^{\mathsf{T}}$$

and to turn it into a generalized linear eigenvalue problem

$$L(\lambda)y := (\lambda \mathcal{E} + \mathcal{A})y = 0$$

of size  $nk \times nk$ .

Damped mechanical system:

$$(\lambda^2 M + \lambda D + K)x = 0$$

Introduce (velocity)  $v = \lambda x$  and obtain companion form

$$\left(\left[\begin{array}{cc} M & 0 \\ 0 & -I \end{array}\right] + \left[\begin{array}{cc} D & K \\ I & 0 \end{array}\right]\right) \left[\begin{array}{c} v \\ x \end{array}\right] = 0.$$

## Definition

For a matrix polynomial  $P(\lambda)$  of degree k, a matrix pencil  $L(\lambda) = (\lambda \mathcal{E} + \mathcal{A})$  is called linearization of  $P(\lambda)$ , if there exist nonsingular unimodular matrices (i.e., of constant nonzero determinant)  $S(\lambda)$ ,  $T(\lambda)$  such that

$$S(\lambda)L(\lambda)T(\lambda) = \operatorname{diag}(P(\lambda), I_{(n-1)k}).$$

A linearization is called strong if also revL is a linearization of revP.

A (10) F (10)

- Companion linearization preserves the algebraic and geometric multiplicities of all finite eigenvalues.
- $\triangleright\,$  There are some difficulties with multiple eigenvalues including  $\infty$  and the singular part, Byers/M./Xu 2007.
- $\triangleright\,$  The geometric multiplicity of the eigenvalue  $\infty$  and the sizes of singular blocks are not invariant under unimodular transformations.
- ▷ Companion linearization destroys the structure.

### The matrix polynomial

$$\boldsymbol{P}(\lambda) = \left[ \begin{array}{cc} \lambda^2 + \lambda + 1 & 1 \\ 1 & 0 \end{array} \right]$$

has only the eigenvalue  $\infty$ . Multiplying from the left with

$$Q(\lambda) = \left[ egin{array}{cc} 1 & -(\lambda^2+\lambda+1) \ 0 & 1 \end{array} 
ight]$$

we obtain

$$T(\lambda) = Q(\lambda)P(\lambda) = \left[egin{array}{cc} 1 & 0 \ 0 & 1 \end{array}
ight]$$

It is not necessary to perform a linearization. Is this a matrix polynomial of degree 1, 2, or one of degree 0 with leading coefficients 0?

Consider the Euler-Lagrange equations of a linear, constrained and damped mechanical system

$$\hat{M}\ddot{x} + \hat{D}\dot{x} + \hat{K}x + \hat{G}^{T}\mu = f(t)$$
$$\hat{G}x = g.$$

The associated matrix polynomial is

$$\boldsymbol{P}(\lambda) = \lambda^{2} \begin{bmatrix} \hat{\boldsymbol{M}} & \boldsymbol{0} \\ \boldsymbol{0} & \boldsymbol{0} \end{bmatrix} + \lambda \begin{bmatrix} \hat{\boldsymbol{D}} & \boldsymbol{0} \\ \boldsymbol{0} & \boldsymbol{0} \end{bmatrix} + \begin{bmatrix} \hat{\boldsymbol{K}} & \hat{\boldsymbol{G}}^{T} \\ \hat{\boldsymbol{G}} & \boldsymbol{0} \end{bmatrix}$$

If  $\hat{M}$  is positive definite and  $\hat{G}$  has full row rank, then the companion form has a Kronecker block associated with  $\infty$  of size 4.

The first order formulation used in multibody dynamics only introduces  $y = \dot{x}$  and not  $\gamma = \dot{\mu}$ .

$$\begin{aligned} M\dot{y} + D\dot{x} + Kx + G^{T}\mu &= f(t), \\ \dot{x} &= y, \\ Gx &= 0 \end{aligned}$$

and the associated linear matrix pencil

$$\tilde{L}(\lambda) = \lambda \begin{bmatrix} M & 0 & 0 \\ 0 & I & 0 \\ 0 & 0 & 0 \end{bmatrix} + \begin{bmatrix} D & K & G^{T} \\ -I & 0 & 0 \\ 0 & G & 0 \end{bmatrix}$$

has a Kronecker block at  $\infty$  of size 3.

### Pros

- ▷ Simpler analysis for first order systems and linear evp's..
- ▷ Not much analysis methods for matrix polynomials.
- No generalization of Jordan/Kronecker canonical form for matrix polynomials.
- Locking, deflation and restart very difficult in nonlinear case.
   Cons
- The condition number (sensitivity) may increase. Tisseur 2000, Higham/Mackey/Tisseur 2007.
- ▷ The size of the problem is increased.
- Symmetry structures may be lost.
- ▷ Approach only works for polynomial or rational nonlinearities.

< ロ > < 同 > < 回 > < 回 >

**Goal:** Find a large class of linearizations for which:

- b the linear pencil is easily constructed;
- structure preserving linearizations exist;
- the conditioning of the linear problem can be optimized; Higham/Mackey/Tisseur 06, Higham/Li/Tisseur 06.
- eigenvalues/vectors of the original problem are easily read off;
- we have structure preserving numerical methods;
- ▷ a structured perturbation analysis is possible.

Notation:  $\Lambda := [\lambda^{k-1}, \lambda^{k-2}, \dots, \lambda, 1]^T$ ,  $\otimes$  - Kronecker product.

# Definition (Mackey<sup>2</sup>/Mehl/M. 2006.)

For a given  $n \times n$  matrix polynomial  $P(\lambda)$  of degree *k* define the sets:

$$\mathcal{V}_{P} = \{ \mathbf{v} \otimes \mathbf{P}(\lambda) : \mathbf{v} \in \mathbb{F}^{k} \}, \text{ } \mathbf{v} \text{ is called right ansatz vector}, \\ \mathcal{W}_{P} = \{ \mathbf{w}^{T} \otimes \mathbf{P}(\lambda) : \mathbf{w} \in \mathbb{F}^{k} \}, \text{ } \mathbf{w} \text{ is called left ansatz vector}, \\ \mathbb{L}_{1}(P) = \{ L(\lambda) = \lambda \mathcal{E} + \mathcal{A} : \mathcal{E}, \mathcal{A} \in \mathbb{F}^{kn \times kn}, L(\lambda) \cdot (\Lambda \otimes I_{n}) \in \mathcal{V}_{P} \}, \\ \mathbb{L}_{2}(P) = \{ L(\lambda) = \lambda \mathcal{E} + \mathcal{A} : \mathcal{E}, \mathcal{A} \in \mathbb{F}^{kn \times kn}, (\Lambda^{T} \otimes I_{n}) \cdot L(\lambda) \in \mathcal{W}_{P} \} \\ \mathbb{D}\mathbb{L}(P) = \mathbb{L}_{1}(P) \cap \mathbb{L}_{2}(P). \end{cases}$$

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

For  $P(\lambda) = \lambda^2 M + \lambda D + K$ , we have

$$\mathbb{L}_{1}(\boldsymbol{P}) = \left\{ \lambda \mathcal{E} + \mathcal{A} : (\lambda \mathcal{E} + \mathcal{A}) \begin{bmatrix} \lambda I_{n} \\ I_{n} \end{bmatrix} = \begin{bmatrix} v_{1} \boldsymbol{P}(\lambda) \\ v_{2} \boldsymbol{P}(\lambda) \end{bmatrix} \right\}.$$

We have the freedom to choose the vector *v*. How can we use this freedom?

## Proposition

### For any $n \times n$ matrix polynomial $P(\lambda)$ of degree k,

 $\mathbb{L}_1(P)$  is a vector space of dimension  $k(k-1)n^2 + k$ ,

 $\mathbb{L}_2(P)$  is a vector space of dimension  $k(k-1)n^2 + k$ ,

 $\mathbb{DL}(P)$  is a vector space of dimension k.

These are not all linearizations but they form a large class.

< □ > < 同 > < 三 > < 三 >

Example

### The first and second companion forms

$$C_{1}(\lambda) := \lambda \begin{bmatrix} A_{k} & 0 & \cdots & 0 \\ 0 & I_{n} & \ddots & \vdots \\ \vdots & \ddots & \ddots & 0 \\ 0 & \cdots & 0 & I_{n} \end{bmatrix} + \begin{bmatrix} A_{k-1} & A_{k-2} & \cdots & A_{0} \\ -I_{n} & 0 & \cdots & 0 \\ \vdots & \ddots & \ddots & \vdots \\ 0 & \cdots & -I_{n} & 0 \end{bmatrix}$$
$$C_{2}(\lambda) := \lambda \begin{bmatrix} A_{k} & 0 & \cdots & 0 \\ 0 & I_{n} & \ddots & \vdots \\ \vdots & \ddots & \ddots & 0 \\ 0 & \cdots & 0 & I_{n} \end{bmatrix} + \begin{bmatrix} A_{k-1} & -I_{n} & \cdots & 0 \\ A_{k-2} & 0 & \ddots & \vdots \\ \vdots & \vdots & \ddots & -I_{n} \\ A_{0} & 0 & \cdots & 0 \end{bmatrix}$$

are linearizations in  $\mathbb{L}_1(P)$ ,  $\mathbb{L}_2(P)$ , respectively.

## Theorem (Mackey, Mackey, Mehl, M. 2006)

Let  $P(\lambda)$  be an  $n \times n$  matrix polynomial of degree k, and let  $L(\lambda)$  be any pencil in  $\mathbb{L}_1(P)$  with ansatz vector  $v \neq 0$ .

Then  $x \in \mathbb{C}^n$  is a right eigenvector for  $P(\lambda)$  with finite eigenvalue  $\lambda \in \mathbb{C}$  if and only if  $\Lambda \otimes x$  is a right eigenvector for  $L(\lambda)$  with eigenvalue  $\lambda$ .

If in addition P is regular, i.e. det  $P(\lambda) \neq 0$ , and  $L \in \mathbb{L}_1(P)$  is a linearization, then every eigenvector of L with finite eigenvalue  $\lambda$  is of the form  $\Lambda \otimes x$  for some eigenvector x of P.

Similar results hold for  $\mathbb{L}_2(P)$ .

### Lemma (Mackey, Mackey, Mehl, M. 2006)

Consider an  $n \times n$  matrix polynomial  $P(\lambda)$  of degree k. Then, for  $v = (v_1, \ldots, v_k)^T$  and  $w = (w_1, \ldots, w_k)^T$  in  $\mathbb{F}^k$ , the associated pencil satisfies  $L(\lambda) = \lambda \mathcal{E} + \mathcal{A} \in \mathbb{DL}(P)$  if and only if v = w.

### Theorem (Mackey, Mackey, Mehl, M. 2006)

Consider an  $n \times n$  matrix polynomial  $P(\lambda)$  of degree k. Then for given ansatz vector  $\mathbf{v} = \mathbf{w} = [\mathbf{v}_1, \dots, \mathbf{v}_k]^T$  the associated linear pencil in  $\mathbb{DL}(P)$  is a linearization if and only if no root of the *v*-polynomial

$$\rho(v; x) := v_1 x^{k-1} + \ldots + v_{k-1} x + v_k$$

is an eigenvalue of P.

# Theorem (Mackey, Mackey, Mehl, M. 2006)

Let  $P(\lambda)$  be a regular matrix polynomial and  $L(\lambda) \in \mathbb{L}_1(P)$  (or  $L(\lambda) \in \mathbb{L}_2(P)$ ). Then the following statements are equivalent.

- (i)  $L(\lambda)$  is a linearization for  $P(\lambda)$ .
- (ii)  $L(\lambda)$  is a regular pencil.
- (iii)  $L(\lambda)$  is a strong linearization for  $P(\lambda)$ .

(I) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1)) < ((1))

Consider the eigenvalue problem.

$$P(\lambda) = \lambda^2 M + \lambda G + K$$

with *K* singular and take  $v = e_1$ . Then  $p(v; x) = 1x^1 + 0x^0$  has an eigenvalue 0, which is an eigenvalue of *P* if *K* is singular.

### Theorem (Mackey, Mackey, Mehl, M. 2006)

For any regular  $n \times n$  matrix polynomial  $P(\lambda)$  of degree k, almost every pencil in  $\mathbb{L}_1(P)$  ( $\mathbb{L}_2(P)$ ) is a linearization for  $P(\lambda)$ . For any regular matrix polynomial  $P(\lambda)$ , pencils in  $\mathbb{DL}(P)$  are linearizations of  $P(\lambda)$  for almost all  $v \in \mathbb{F}^k$ .

'Almost every' means for all but a closed, nowhere dense set of measure zero.

- Perturbation analysis Tisseur 00, Higham/Mackey/Tisseur 06, Higham/Li/Tisseur 06.
- ▷ Computation of a simple eigenvalue  $\hat{\lambda}$  via the linearized eigenvalue problem is very ill-conditioned if  $p(v, \hat{\lambda})$  is small.
- Proper scaling is necessary.
- Open problem. Does the solution via a good, properly scaled, structure preserving linearization produce generally better results than the direct solution of the original structured problem.

A (1) > A (2) > A

- Companion linearization has some problems for infinite eigenvalue and singular parts.
- ▷ Companion linearization destroys the structure.
- ▷ If no 'bad eigenvalues' occur, then there exist structured linearizations in DL(P).
- Linearizations are ill-conditioned if eigenvalues near the bad eigenvalues occur. Higham/Mackey/Tisseur 2006.
- Unified theory for pseudospectra of matrix pencils/polynomials Ahmad 2008.
- We need to deflate bad eigenvalues/near bad eigenvalues?

- The railtrack problem has a majority of infinite eigenvalues (all interior FEM nodes). It also has a few eigenvalues near -1. Structured and nonstructured linearizations are very ill-conditioned.
- The problem in crack following has multiple eigenvalues and eigenvalues at 0.
- The complex symmetric car acoustic problem is sometimes singular and has a lot of infinite eigenvalues.

To get accurate numerical results it is essential to deflate 'bad' evs in a structured way. ( $\rightarrow$  second talk)

# Introduction Nonlinear EVP in practice, fast trains Nonlinear EVP in practice, car acoustics Nonlinear EVP in practice, 3D elastic field near crack Numerical Methods for nonlinear EVP's Linearization Numerical methods for linear generalized evp's Conclusions

- Industrial PDE applications lead to nonlinear eigenvalue problems.
- These sometimes have extra structure that reflects the physical properties.
- The analysis and numerical solution methods for genuinely nonlinear eigenvalue problems are not well-enough understood.
- The eigenvalue methods should be intertwined with the discretization methods. (Adaptivity of discretization and eigenvalue iteration).
- The numerical methods need to reflect structures of the physical problems.
- Deflation of 'bad' parts of the spectrum is necessary for good numerical solutions.
