PARTIAL DIFFERENTIAL EQUATIONS III & V PROBLEM CLASS 5

Exercise 1 (*Hölder inequality*). The so-called Hölder inequality which states that for for (measurable) set $E \subseteq \mathbb{R}^n$ and any $f \in L^p(E)$ and $g \in L^q(E)$ where p and q Hölder conjugate, i.e. $p, q \in [1, \infty]$ and 1/p + 1/q = 1 we have that¹

$$\int_{E} |f(x)g(x)| \, dx \le \|f\|_{L^{p}(E)} \, \|g\|_{L^{q}(E)} \, dx$$

where $L^p(E)$ is defined like $L^p(\mathbb{R}^n)$ where the set on which we integrate is *E* instead of \mathbb{R}^n .

- (i) Prove Hölder inequality when $E = \mathbb{R}^n$, $p = \infty$ and q = 1. You may assume that f is bounded on \mathbb{R}^n (and as such use sup instead of esssup).
- (ii) Show that if $f \in C_c(\mathbb{R}^n)$ and $g \in L^p(\mathbb{R}^n)$ then there exists a compact set $K \subset \mathbb{R}^n$ such that

$$\int_{\mathbb{R}^n} |f(x)g(x)| \, dx \le \|f\|_{L^{\infty}} |K|^{\frac{1}{q}} \left(\int_K |g(x)|^p \, dx \right)^{\frac{1}{p}}.$$

(iii) Use Hölder inequality to show that if $f \in L^p(\mathbb{R}^n)$ and $g \in L^q(\mathbb{R}^n)$ with p and q Hölder conjugates we have that

$$\sup_{x \in \mathbb{R}^n} |f * g(x)| = ||f * g||_{L^{\infty}(\mathbb{R}^n)} \le ||f||_{L^p(\mathbb{R}^n)} ||g||_{L^q(\mathbb{R}^n)}.$$

Exercise 2 (Poincaré-like inequalities).

(i) Using the formula

$$f(x) - f(y) = \int_{y}^{x} f'(s) ds$$

which holds for any C^1 function on an interval that contains x and y, together with Hölder's inequality show that for any Hölder conjugates p and q, any $f \in C^1([a, b])$, and any $c \in [a, b]$ we have that

$$\sup_{x \in [a,b]} |f(x) - f(c)| \le (b-a)^{\frac{1}{q}} \|f'\|_{L^p([a,b])},$$

¹One particular case that is worth to mention is when p = q = 2. This case is the famous Cauchy-Schwarz inequality and it reads as

$$\int_{E} |f(x)g(x)| \, dx \leq \left(\int_{E} |f(x)|^{2} \, dx \right)^{\frac{1}{2}} \left(\int_{E} |g(x)|^{2} \, dx \right)^{\frac{1}{2}}$$

where *q* is the Hölder conjugate of *p*.

(ii) Conclude that for any $p \in [1,\infty]$ and $r \in [1,\infty)$, any $f \in C^1([a,b])$, and any $c \in [a,b]$ we have that

$$\left(\int_{a}^{b} \left|f(x) - f(c)\right|^{r} dx\right)^{\frac{1}{r}} \le (b - a)^{\frac{1}{q} + \frac{1}{r}} \left\|f'\right\|_{L^{p}([a,b])}.$$

or equivalently

$$\|f - f(c)\|_{L^r([a,b])} \le (b-a)^{\frac{1}{q}+\frac{1}{r}} \|f'\|_{L^p([a,b])}$$

Note that due to our previous sub-question the above remains true when $r = \infty$.

(iii) Use sub-question ii to conclude that for any $f \in C^1([a, b])$ and any $p \in [1, \infty]$ we have

$$\left\| f - \overline{f} \right\|_{L^{p}([a,b])} \le (b-a) \left\| f' \right\|_{L^{p}([a,b])}$$

where

$$\overline{f} = \frac{1}{b-a} \int_{a}^{b} f(s) ds.$$

(iv) Use sub-question ii to conclude that for any $f \in C^1([a, b])$ such that f(c) = 0 for some $c \in [a, b]$ and any $p \in [1, \infty]$ we have

$$\|f\|_{L^{p}([a,b])} \le (b-a) \|f'\|_{L^{p}([a,b])}$$

Exercise 3 (The Poincaré constant).

(i) Let Ω be an open bounded domain in \mathbb{R}^n with smooth boundary. Consider the PDE

(1)
$$\begin{aligned} -\Delta u(x) &= \lambda u(x) \quad \text{in } \Omega, \\ u(x) &= 0 \quad \text{on } \partial \Omega, \end{aligned}$$

where $u \in C^2(\overline{\Omega})$ and $\lambda \in \mathbb{R}$. By multiplying the above by u and integrating by parts show that if $u \neq 0$ we have that

(2)
$$\lambda = \frac{\int_{\Omega} |\nabla u(x)|^2 dx}{\int_{\Omega} u^2(x) dx} \ge 0.$$

This is known as the *Rayleigh quotient formula* for the eigenvalue λ in terms of the eigenfunction u.

Remark: This procedure, where we multiplied by a function, integrated, and recovered a functional that helps us understand our equation better is known as the *energy method* (the functional we found is our "energy"). This is an important method which will repeat in this module.

2

Remark: We could allow *u* to have values in \mathbb{C} . In that case we would multiply our PDE with \overline{u} and conclude that

$$\lambda = \frac{\int_{\Omega} |\nabla u(x)|^2 \, dx}{\int_{\Omega} |u(x)|^2 \, dx} \ge 0.$$

(ii) Show that any λ that satisfies our PDE must satisfy

$$\lambda \ge \frac{1}{C_P^2}$$

where C_P is the Poincaré inequality that is associated to Ω and the Dirichlet boundary condition, i.e. the best constant for which

$$\int_{\Omega} |u(x)|^2 dx \le C_P^2 \int_{\Omega} |\nabla u(x)|^2 dx.$$

Remark: The above implies that

$$\min_{\text{eigenvalues}} \lambda \geq \frac{1}{C_P^2}.$$

One can in fact show that there is equality in the above. This is connected to minimising the energy

$$E[u] = \frac{\int_{\Omega} |\nabla u(x)|^2 dx}{\int_{\Omega} |v(x)|^2 dx}$$

over an appropriate space of *functions*.
