## Assignment 17-18

Starred problems due on Friday, 15 March
17.1. Prove that any pair of parallel lines can be transformed to any other pair of parallel lines by an isometry.
17.2. Let $A, B \in \gamma$ be two points on a horocycle $\gamma$. Show that the perpendicular bisector to $A B$ is orthogonal to $\gamma$.
17.3. Let $l_{1}, l_{2}, l_{3}$ be three lines in $\mathbb{H}^{2}$, let $r_{i}$ be the reflection with respect to $l_{i}$ and let $f=r_{3} \circ r_{2} \circ r_{1}$. Show that $f$ is either a reflection or a glide reflection, i.e. a hyperbolic translation along some line composed with a reflection with respect to the same line.

Assuming that the lines $l_{1}, l_{2}, l_{3}$ are not passing through the same point and not having a common perpendicular, show that $f$ is a glide reflection.
17.4. $\left(^{*}\right)$ Given an isometry $f$ of the hyperbolic plane such that the distance from $A$ to $f(A)$ is the same for all points $A \in \mathbb{H}^{2}$, show that $f$ is the identity map.
17.5. $\left(^{*}\right)$ Let $a$ and $b$ be two vectors in the hyperboloid model such that $\langle a, a\rangle>0$ and $\langle b, b\rangle>0$. Let $l_{a}$ and $l_{b}$ be the lines determined by equations $\langle x, a\rangle=0$ and $\langle x, b\rangle=0$ respectively. And let $r_{a}$ and $r_{b}$ be reflections with respect to $l_{a}$ and $l_{b}$.
(a) For $a=(0,1,0)$ and $b=(1,0,0)$ write down $r_{a}$ and $r_{b}$. Find $r_{b} \circ r_{a}(v)$, where $v=(0,1,2)$.
(b) What type is the isometry $\phi=r_{b} \circ r_{a}$ for $a=(1,1,1)$ and $b=(1,1,-1)$ ? (Hint: you don't need to compute $r_{a}$ and $r_{b}$ ).
(c) Find an example of $a$ and $b$ such that $\phi=r_{b} \circ r_{a}$ is a rotation by $\pi / 2$.
18.1 Let $l$ be a line on the hyperbolic plane and let $E_{l}$ be the equidistant curve for $l$.
(a) Let $C_{1}$ and $C_{2}$ be two connected components of the same equidistant curve $E_{l}$. Show that that $C_{1}$ is also equidistant from $C_{2}$, i.e. given a point $A \in C_{1}$ the distance $d\left(A, C_{2}\right)$ from $A$ to $C_{2}$ does not depend on the choice of $A$.
(b) Let $A \in E_{l}$ be a point on the equidistant curve, and let $A_{l} \in l$ be the point of $l$ closest to $A$. Show that the line $A A_{l}$ is orthogonal to the equidistant curve.
(c) Let $P, Q \in l$ be two points on $l$. Let $A \in E_{l}$ be a point of the equidistant curve such that the segments $A P$ and $A Q$ contain no point of $E_{l}$ except $A$. Continue the rays $A P$ and $A Q$ till the next intersection points with $E_{l}$, denote the resulting intersection points by $B$ and $C$. Let $T$ be a curvilinear triangle $A B C$ (with geodesic sides $A B$ and $A C$, but $B C$ being a segment of the equidistant curve). Assuming that all angles of $A B C$ are acute show that the area of $T$ does not depend on the choice of $A \in E_{l}$.
(d) With the assumptions of (c), show that the area of the geodesic triangle $A B C$ does not depend on the choice of $A$.
18.2. (*)
(a) Let $l$ and $l^{\prime}$ be ultra-parallel lines. Let $\gamma$ be an equidistant curve for $l$ intersecting $l^{\prime}$ in two points $A$ and $B$. Denote by $h$ the common perpendicular to $l$ and $l^{\prime}$ and let $H=h \cap l^{\prime}$ be the intersection point. Show that $A H=H B$.
(b) Let $l$ be a line and $\gamma$ be an equidistant curve for $l$. For two points $A, B$ on one component of $\gamma$, show that the perpendicular bisector of $A B$ is also orthogonal to $l$.
(c) Let $A B C$ be a triangle in the Poincare disc model. Let $\gamma$ be a Euclidean circumscribed circle (i.e. a circumscribed circle for $A B C$ considered as a Euclidean triangle). Suppose that $\gamma$ intersects the absolute at points $X$ and $Y$. Show that the (hyperbolic) perpendicular bisector to $A B$ is orthogonal to the hyperbolic line $X Y$.
(d) Show that three perpendicular bisectors in a hyperbolic triangle are either concurrent, or parallel, of have a common perpendicular.
