

## Inversion

### Practice list

For a circle  $C$  in the Euclidean plane the *inversion*  $i_C$  in  $C$  is the unique map from the complement of  $C$  to itself that fixes any point of  $C$ , exchanges the interior and exterior of  $C$  and takes circles orthogonal to  $C$  to themselves.

1. (a) Show the following fact from Euclidean geometry: If  $A$  is a point outside a circle  $C$  and  $l$  is a line through  $A$  intersecting  $C$  at  $P$  and  $P'$ , the product  $AP \cdot AP'$  is independent of  $l$  and equals  $AT^2$ , where  $AT$  is a segment tangent to  $C$  at  $T$ .
  - (b) Show that if a circle  $C$  has center  $O$  and radius  $r$ , and a circle  $C_1$  is orthogonal to  $C$  and contains a point  $P$ , then  $C_1$  contains a point  $P'$  on the ray  $\overline{OP}$  such that  $OP \cdot OP' = r^2$ .
  - (c) Show that inversion is well-defined by proving that  $i_C(P) = P'$ .
2. (a) Denote by  $F_t$  the family of circles through  $x \in C$  tangent to  $C$ . Show that  $i_C(F_t) = F_t$ . (Hint: consider the family  $F_o$  of circles through  $x$  orthogonal to  $C$ .)
  - (b) Denote by  $T_\lambda$  the homothety with coefficient  $\lambda$  centered at the center of  $C$ . Show that  $i_C \circ T_\lambda = T_{1/\lambda} \circ i_C$ .
  - (c) If  $O$  is the center of  $C$ , the inversion  $i_C$  takes
    - circles through  $O$  to lines;
    - rest circles to circles;
    - lines through  $O$  to themselves;
    - rest lines to circles through  $O$ .
3. Let  $C$  be the circle  $x^2 + y^2 = 1$ . Draw the image  $i_C(P)$ , where  $P$  is
  - (a) the circle  $(x - 4)^2 + y^2 = 4$ ;
  - (b) the circle  $(x - \sqrt{2})^2 + (y - \sqrt{2})^2 = 1$ ;
  - (c) the line  $x = \frac{1}{2}$ ;
  - (d) the square with vertices  $(-1, 1), (1, -1), (-1, -3), (-3, -1)$ ;
  - (e) the upper half-plane  $y \geq 0$ .
4. Let  $i_C$  be the inversion in the circle  $C$ . Let  $C_1$  and  $C_2$  be a pair of tangent circles. Find the image  $i_C(C_1 \cup C_2)$ . How does it depend on  $C$ ?
5. Show that  $i_C$  is conformal, i.e. it preserves angles.
6. Show that for any pair of non-intersecting circles  $C_1$  and  $C_2$  there exists a circle  $C$  such that  $i_C$  takes  $C_1$  and  $C_2$  to concentric circles.
